EXECUTIVE SUMMARY

Langan has prepared this traffic impact study to identify the potential impacts of the proposed warehouse at 67 Kennedy Road in South Windsor, Connecticut (See **Figure 1**). The project site is approximately 19.2-acres of vacant land.

The project includes the construction of a ±241,800 square-foot warehouse with approximately 141 car parking spaces, 59 trailer spaces, and 25 loading docks and associated site improvements. The proposed development will have three driveways on Kennedy Road, and one exit-only truck driveway on Sullivan Avenue. The three driveways on Kennedy Road will each operate as full-movement stop-controlled driveways. The driveway on Sullivan Avenue will be exclusively for trucks and will be exit-only and right-turn only. Trucks are only to be allowed to enter the site through driveway located at the northern-most end of Kennedy Road, where a truck turn-around circle and public cul-de-sac will be constructed (See Site Plan in **Appendix A**). The proposed warehouse is expected to be operational by 2023.

No tenant has been selected for the proposed building at this time, therefore Langan used the Institute of Transportation Engineers (ITE) land-use code 150 to develop the trip generation for the proposed warehouse and site use. These trip generation volumes were used to evaluate the peak-hour and average daily traffic (ADT) for the 2023 build-year traffic operations conditions. Anticipated truck trip generation volumes were also evaluated for the peak-hour and average daily traffic. The project was designed in accordance with the South Windsor access management plan per Section 5.5.4 of the zoning regulations.

Video turning-movement and vehicle-classification were conducted in February 2022, at four roadway network intersections and used as a basis for this evaluation. According to the results of the analyses, the existing roadway is adequate to support the increase in traffic volume that will be generated by the proposed warehouse development.

Langan conducted a signal warrant analysis at the intersection of Kennedy Road and Sullivan Avenue using the traffic counts conducted in February 2022 as the basis for the analysis. The analysis revealed that under existing conditions, the intersection warrants a traffic signal. Under build conditions, a signal would also be warranted.

1.0 INTRODUCTION

Langan has prepared this traffic impact study to identify the potential impacts of the proposed warehouse at 67 Kennedy Road in South Windsor, Connecticut (See **Figure 1** for the Location Map). The 19.2-acre vacant site is on the northwest corner of Kennedy Road and Sullivan Avenue. Commercial uses exist to the west of the development site, Kennedy Road borders the site to the east, Sullivan Avenue borders the site to the south, and train tracks owned by Conrail to the north.

The proposed warehouse development will include a ±241,800 square-foot building with approximately 141 car parking spaces, 59 trailer spaces, and 25 loading docks and associated landscaping, utility improvements and stormwater systems (See Site Plan in **Appendix A**). The proposed development is anticipated to be in operation in 2023.

2.0 SITE ACCESS AND STUDY LOCATIONS

Site Access

The proposed development will have three driveway connections to Kennedy Road, and one driveway access to Sullivan Avenue. The three driveways on Kennedy Road will operate as full-movement stop-controlled driveways. The driveway on Sullivan Avenue will be for exiting truck traffic only and will only allow right turns. Trucks will be expected to enter the site through the driveway located at the northern-most end of Kennedy Road, where a truck turn circle will be constructed for ease of entry. A cul-de-sac at the end of Kennedy Road is also proposed to provide sufficient space to turn around for public vehicles. A cul-de-sac does not currently exist on Kennedy Road.

Study Locations

Four key intersections were evaluated in this study (See **Figure 2**).

- John Fitch Boulevard (US-5) and Sullivan Avenue (Route 194)
- Sullivan Avenue (Route 194) & Rye Street
- Sullivan Avenue (Route 194) & Kennedy Road
- Sullivan Avenue (Route 194) & Ayers Road

3.0 EXISTING CONDITIONS

Area Roadway Network

John Fitch Boulevard (U.S. Route 5) is a four lane, north-south principal arterial under state jurisdiction. The north and south lanes are separated by a 12-foot wide painted median with guardrails. *U.S. Route 5* provides two 12-foot wide thru travel lanes in each direction, with a 6-foot shoulder that varies along the length of the road on the outside of each travel lane, with a posted speed limit of 50 MPH.

Sullivan Avenue (Route 194) from John Fitch Boulevard to Rye Street is a four lane, east-west minor arterial under state jurisdiction. Sullivan Avenue provides two 11-foot wide travel lanes in each direction with 4-foot wide shoulders on both sides of the road. The stretch of Sullivan Avenue from Rye Street to Ayers Road is a two lane, east-west minor arterial that provides one 12-foot wide travel lanes in each direction with variable width shoulders on both sides of the road. Sullivan Avenue in the vicinity of the project has a posted speed limit of 40 MPH.

Rye Street is a two-lane northeast-southwest urban collector under local jurisdiction. Rye Street provides one 11-foot wide travel lane in each direction with 3-foot wide shoulders in either direction. Rye Street in the vicinity of the project has a posted speed limit of 35 MPH.

Kennedy Road is a two-lane north-south local road. Kennedy Road provides one 12-foot wide travel lane in each direction with a shoulder on the west side of the road that starts to taper 175 feet in advance of the stop bar into a width of 9 feet. The east side of the road provides no shoulder. Kennedy Road has a speed limit of 30 MPH, with no sign posted.

Study Intersections

John Fitch Boulevard (US-5) and Sullivan Avenue (Route 194) is a signalized four-way intersection with the following geometry:

- John Fitch Boulevard Northbound – one left-turn only lane with approximately 250 feet of storage, two thru-only lanes, and one right-turn only lane with approximately 250 feet of storage.
- John Fitch Boulevard Southbound – two left-turn only lanes with approximately 575 feet of storage, one thru lane, and one shared right-turn/thru lane where the right-turn lane splits off and becomes an exclusive channelized right-turn lane approximately 75 feet in advance of the stop bar.
- Sullivan Avenue (Route 194) Eastbound – one shared right-turn/thru lane.

- Sullivan Avenue (Route 194) Westbound – one left-turn only lane, one thru lane, and one right-turn only lane.

Sullivan Avenue (Route 194) & Rye Street is a signalized four-way intersection with the following geometry:

- 135 Sullivan Avenue Driveway Northbound – one left-turn only lane, and one shared right-turn/thru lane.
- Rye Street Southbound – one shared right-turn/left-turn/thru lane.
- Sullivan Avenue (Route 194) Eastbound – one left-turn only lane, one thru lane, and one shared right-turn/thru lane.
- Sullivan Avenue (Route 194) Westbound – one left-turn only lane, and one shared right-turn/thru lane.

Sullivan Avenue (Route 194) & Kennedy Road is an unsignalized four-way intersection with the following geometry:

- 425 Sullivan Avenue Driveway Northbound – one stop-controlled shared right-turn/thru/left-turn lane.
- Kennedy Road Southbound – one stop-controlled shared right-turn/thru/left-turn lane.
- Sullivan Avenue (Route 194) Eastbound – one free flow shared right-turn/thru/left-turn lane.
- Sullivan Avenue (Route 194) Westbound – one free flow shared right-turn/thru/left-turn lane.

Sullivan Avenue (Route 194) & Ayers Road is a signalized “T” intersection with the following geometry:

- Sullivan Avenue Northbound – one left-turn only lane and one thru lane.
- Sullivan Avenue Southbound – one left-turn only lane and one thru lane.
- Ayers Road Westbound – one left-turn only lane, and one right-turn only lane.

4.0 INTERSECTION CAPACITY ANALYSIS MEASURES

Langan conducted capacity analyses for the existing, background and build traffic conditions to assess quality of traffic flow. Capacity analyses provide an indication of the adequacy of the road and intersections to serve traffic demands.

Level of Service Criteria

Level of Service (LOS) is the term used to denote the different operating conditions that occur at an intersection under various traffic volume demands. LOS is a qualitative

measure that considers a number of factors including road geometry, speed and travel delay. LOS provides an index to the operational qualities of an intersection. LOS designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. The LOS designation is reported differently for signalized intersections and unsignalized intersections.

For signalized intersections, the analysis considers the operation of all traffic entering the intersection. For unsignalized intersections, however, the analysis considers the operation of all movements that are in conflict with other movements such as mainline left turns and traffic exiting the side street. An overall LOS is given for signalized intersections. For unsignalized intersections, LOS is given for each specific approach.

The evaluation criteria used to analyze the study area intersections are based on the Highway Capacity Manual (HCM) 6th Edition, published by the Transportation Research Board (TRB). SYNCHRO Plus SimTraffic 10 was used to facilitate computer calculation for the capacity analyses at each intersection.

The HCM 6th Edition defines level of service for signalized intersections as follows:

<u>Level of Service</u>	<u>Control Delay per Vehicle (sec/veh)</u>
A	≤ 10
B	>10 – 20
C	>20 – 35
D	>35 – 55
E	>55 – 80
F	>80

The HCM defines level of service for unsignalized intersections as follows:

<u>Level of Service</u>	<u>Control Delay per Vehicle (sec/veh)</u>
A	≤ 10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F	> 50

5.0 METHODOLOGY AND ANALYSIS

To assess the potential traffic impact of the proposed development, Langan employed a five-step methodology outlined below and described in detail in subsequent sections 5.1 through 5.5:

- Step One: Determine the existing peak-hour traffic volumes and evaluate existing traffic operating conditions for the study intersections.
- Step Two: Project the existing peak-hour traffic volumes (Step One) to create 2023 Background peak-hour traffic volumes (including approved or pending developments in the area) and evaluate traffic operating conditions for the study intersections.
- Step Three: Determine the traffic volumes to be generated by the proposed development. Distribute and assign these site traffic volumes throughout the study area roadway network.
- Step Four: Combine the Background traffic volumes (Step Two) with the assigned proposed traffic (Step Three) to establish 2023 Build traffic volumes. Determine traffic operating conditions and identify mitigation of potential impacts.
- Step Five: Investigate the safety conditions within the area roadway network.

5.1 Step One: Determine the existing peak-hour traffic volumes and evaluate traffic operating conditions for the study intersections.

Existing Peak-Hour Traffic Volumes

Video turning-movement counts (TMC's) and vehicle classification counts were conducted on Wednesday, February 2022 to determine the existing peak-hour traffic volumes. The TMC's and vehicle classification counts were conducted on a weekday during the morning (6:30 a.m. to 9:00 a.m.) and evening (3:30 p.m. to 6:00 p.m.) peak periods of the development. During these study periods, the peak-hours of the adjacent roadway network generally occurred from 7:30 to 8:30 a.m. and 4:15 to 5:15 p.m.

2022 Existing Traffic Operating Conditions

The traffic operating conditions for the study area intersections were analyzed during the roadway peak-hour periods using the 2022 existing traffic volumes. **Figure 3** illustrates the 2022 existing peak-hour traffic volumes. A summary of the traffic operating conditions is provided in **Tables 3 and 4**. Detailed reports can be found in **Appendix B**.

5.2 Step Two: Project the existing peak-hour traffic volumes (Step One) to create 2023 Background peak-hour traffic volumes (Including approved or pending developments in the area) and evaluate traffic operating conditions for the study intersections.

Background Peak-Hour Traffic Volumes

Background traffic growth was estimated based on historical data available from ConnDOT in the vicinity of the project. A review of the ConnDOT data indicates that traffic volumes in South Windsor have fluctuated over the last several years, but generally decreased. In order to be conservative and consistent with other approved traffic studies in South Windsor, a growth rate of 0.5% annually was applied to the existing traffic volumes to develop the 2023 background ambient growth peak-hour traffic volumes shown on **Figure 4A**.

In addition to applying this growth rate, we also considered approved or pending developments in the area that may add substantial traffic volume to the study area intersections. Based on discussions with the town of South Windsor, there are two previously approved developments which are to be included in our background traffic conditions. One is a multi-building commercial development at 150 Sullivan Avenue and the other is the Sullivan Avenue Plaza Zone Change and General Plan located at 955 Sullivan Avenue. Both the development's background traffic volumes are shown in **Figures 4B and Figure 4C**, respectively.

2023 Background Traffic Operating Conditions

The traffic operating conditions for the study area intersections were analyzed during the peak-hour periods using the 2023 background traffic volumes illustrated in **Figure 4**. A summary of the traffic operating conditions is provided in **Tables 3 and 4**. Detailed reports can be found in **Appendix C**.

5.3 Step Three: Determine the traffic volumes to be generated by the proposed development. Distribute and assign these site traffic volumes throughout the study area roadway network.

The project includes the construction of a ±241,800 square-foot warehouse with approximately 141 car parking spaces, 59 trailer spaces, and 25 loading docks and associated site improvements (See Site Plan in **Appendix A**).

Site Operations

The proposed development will have three driveway connections to Kennedy Road, and one driveway access to Sullivan Avenue. The three driveways on Kennedy Road will

operate as full-movement stop-controlled driveways. The driveway on Sullivan Avenue will be exclusively for trucks and will be exit-only and right-turn only. Trucks are only to be allowed to enter the site through driveway located at the northern-most end of Kennedy Road, where a truck turn-around circle will be constructed.

Site Access & Circulation

All traffic for the site is to enter through the intersection of Kennedy Road and Sullivan Avenue. Passenger car traffic will then enter their designated parking area, located on the east side of the building, at either the south Kennedy Road Driveway, or the middle Kennedy Road Driveway. Trucks will enter their designated parking/loading areas, located on the west side of the building, through the northern Kennedy Road Driveway where a truck turn-around and public cul-de-sac will be constructed. The site design is intended to separate truck traffic and passenger car traffic as much as possible, allowing for ease of access to their separate parking areas. In addition, providing safer conditions for employee foot traffic walking to and from their vehicles in the passenger car/employee parking lot. Passenger cars will be allowed to exit the parking area at any of the Kennedy Road driveway connections, and exit onto Sullivan Avenue through the intersection of Sullivan Avenue & Kennedy Road. Exiting trucks heading westbound will exit through the right-turn only and exit-only driveway on Sullivan Avenue at the southwest corner of the site. Eastbound exiting trucks will access Kennedy Road from the north side of the building and turn left onto Sullivan Avenue.

The proposed site plan is aligned with the access management plan implemented by South Windsor in Section 5.5.4 of the zoning regulations. As part of the project, an access easement will be granted to 330 Sullivan Avenue to the west for a potential future driveway connection to Sullivan Avenue. The location of this future driveway will allow 330 Sullivan to access Sullivan Avenue directly across from Schwier Road, forming a four-way intersection. Additionally, all access from the 67 Kennedy Road development will access Sullivan Avenue via Kennedy Road and will not create an additional curb cut on Sullivan Avenue.

Peak-Hour Trip Generation

No tenant has been selected for the proposed building at this time, therefore the anticipated number of peak-hour trips generated by the proposed facility is based on rates established in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition. Land Use Code 150: Warehouse was selected based on a representative trip generation estimate and the intended building use. Overall, the number of trips the proposed development is expected to generate is 53 for the morning peak hour, and 55 for the evening peak hour. **Table 1** below identifies the anticipated peak-hour trip generation of the proposed development using ITE data. Detailed trip generation information is included in **Appendix E**.

TABLE 1 ANTICIPATED TRIP GENERATION – 67 KENNEDY RD WAREHOUSE							
USE	LAND USE CODE ¹	AM PEAK HOUR			PM PEAK HOUR		
		ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
Warehousing (241,800 SF)	150	41	12	53	15	40	55

¹ Land Use Codes based on ITE Trip Generation Manual 11th Edition

The site-generated traffic peak-hour volumes were distributed to and from the site onto the roadway network based on anticipated travel patterns of employees and journey to work data obtained for the town of South Windsor. The anticipated percent distribution of the site generated trips is illustrated in **Figure 5**. **Figure 6** illustrates the assignment of the peak-hour site-generated trips, indicated in **Table 1**, into the area roadway network.

Truck Trip Generation & Distribution

The anticipated number of truck trips to be generated by the proposed facility is based on rates established in the ITE Trip Generation Manual 11th Edition. Again, Land Use Code 150: Warehousing was selected. Overall, the number of truck trips the proposed development is expected to generate is 7 trips for the morning peak hour, 10 trips for the evening peak hour, and 138 trips throughout a typical weekday. **Table 2** below identifies the anticipated peak hour and daily truck trip generation of the proposed development using ITE data.

TABLE 2 ANTICIPATED TRUCK TRIP GENERATION – 67 KENNEDY RD WAREHOUSE					
USE	LAND USE CODE ¹	AM PEAK HOUR		PM PEAK HOUR	DAILY ADT
		TOTAL		TOTAL	TOTAL
Warehousing (241,800 SF)	150	7		10	138

¹ Land Use Codes based on ITE Trip Generation Manual 11th Edition

The site has been designed to have all truck traffic access the site via the Kennedy Road & Sullivan Avenue intersection, and continue to the end of Kennedy Road where they will enter the property through the northern-most Kennedy Road driveway. Trucks will then continue through the site counter-clockwise to their designated trailer parking spaces or loading docks located on the west side of the building. Exiting trucks heading westbound will exit through the right-turn only and exit-only driveway on Sullivan Avenue at the southwest corner of the site. Eastbound exiting trucks will access Kennedy Road from the north side of the building and turn left onto Sullivan Avenue. Queuing space for entering trucks is provided along the north wall of the building, with space for approximately 7 trucks (WB-67).

Trucks are anticipated to use only state roads, with the exception of Kennedy Road, in accessing the site. Regional truck access is available from Interstate 291, Interstate 84, and Interstate 91 to the south, east and west. Trucks can drive to and from the site to these regional truck routes via Route 5 and Route 194 (Sullivan Avenue).

5.4 Step Four: Combine the Background traffic volumes (Step Two) with the assigned proposed traffic (Step Three) to establish 2023 Build traffic volumes. Determine traffic operating conditions and identify mitigation of potential impacts.

Build Traffic Volumes

To evaluate the impacts of the proposed development, the proposed trip assignment volumes (**Figure 6**), as distributed on the roadway network, are combined with the background traffic volumes (**Figure 4**). **Figure 7** illustrates the 2023 build traffic volumes in the roadway network during the peak-hour periods.

Build Traffic Operating Conditions

The resulting traffic volumes illustrated in **Figure 7** were evaluated to determine the effective operating conditions of the study area intersections without any proposed improvements. **Tables 3 and 4** compare the traffic operating conditions for the study area intersections during the peak-hour periods. **Appendix D** provides detailed reports for the 2023 build conditions.

Queuing Evaluation

In addition to the traffic operating conditions, we evaluated the resulting vehicular queuing for all conditions to assess the impacts at study intersections. In evaluating queuing length, the industry standard is to utilize the 50th and the 95th percentile queue lengths developed by the analysis. The 50th percentile queue represents the average or typical vehicular queue that can be expected during the peak-hour. The 95th percentile queue length represents the queuing experience during the highest peak periods, which accounts for 5% of the analysis period. Queues are calculated in feet, and approximately 25 feet of queue is equal to a single vehicle.

Tables 3 and 4 provide the expected 50th and 95th percentile queue lengths for the analyzed periods. For most analyzed intersections, queue lengths do not increase more than four car lengths. Any increase in queuing due to the proposed development is minimal and the existing roadway network can fully accommodate the anticipated queues.

Analysis Results

The analysis of the study intersections reveals that all the signalized intersections analyzed will maintain overall acceptable or background operating conditions for the 2023 build scenario. Individual movements and lane groups may change slightly in level of service, delay, and queue length; however, overall levels of service at these signalized intersections analyzed remain unchanged or acceptable, with nominal impacts to intersection delays. The level of service for each individual movement is maintained from the background conditions to the build conditions, with the exception of the eastbound movement during the morning peak period at the intersection of John Fitch Boulevard and Sullivan Avenue. This movement goes from LOS D under the background conditions to LOS E under the build conditions, however, the delay for this movement only increases by 0.2 seconds, from 54.9 seconds to 55.1 seconds.

5.5 Step Five: Investigate the safety conditions within the area roadway network.

Intersection Sight Distance

Langan evaluated the intersection sight distances (ISD) at the proposed site driveways on Kennedy Road and Sullivan Avenue to confirm that they will meet the town of South Windsor requirements for entering and exiting vehicles based on standards from ConnDOT Highway Design Manual Section 11-2. Sight distances requirements for the town of South Windsor are based on minimum requirements established by the Connecticut Highway Design Manual and the American Association of State Highway and Transportation Officials (AASHTO) as outlined in *A Policy on Geometric Design of Highways and Streets*, 6th Edition (also known as the AASHTO Green Book). As shown in **Table 5**, the proposed intersection sight distances (ISDs) provided at the site driveways meet AASHTO's minimum requirements.

TABLE 5
INTERSECTION SIGHT DISTANCE SUMMARY

LOCATION	Design Speed	Intersection Sight Distance			
		Passenger Car		Combination Truck	
		Required	Provided	Required	Provided
Middle Kennedy Rd Driveway & Kennedy Road					
Looking Left (Kennedy Road Southbound)	30 mph ¹	±335 ft	>335 ft	-	-
Looking Right (Kennedy Road Northbound)	30 mph ¹	±335 ft	>335 ft	-	-
Southern Kennedy Rd Driveway & Kennedy Road					
Looking Left (Kennedy Road Southbound)	30 mph ¹	±335 ft	>335 ft	-	-
Looking Right (Kennedy Road Northbound)	30 mph ¹	±335 ft	To Sullivan Ave	-	-
Southern Sullivan Avenue Exit Only Driveway & Sullivan Avenue					
Looking Left (Sullivan Avenue Westbound)	40 mph ²	-	-	±560 ft	600 ft

¹ Design speed of 30 MPH based on speed limit of Kennedy Road (30 MPH)

² Design speed of 40 MPH based on speed limit of Sullivan Avenue (40 MPH)

Accidents

The most recent three years of accident data were requested via the online UConn Crash Data Repository website in order to conduct an accident analysis in the project vicinity. The collected data included accidents from 2019 to 2021 and accidents included various types of crashes which are behaviors typical at signalized intersections. Specifically at the intersection of Sullivan Avenue and Kennedy Road, only four accidents were reported in these three years, with a low average rate of 1.33 accidents per year.

Across the study area, twenty-four of the reported accidents resulted in injuries, with no fatalities. The majority of accidents occurred during dry weather conditions (75%) and during daylight hours (80%). The majority of accidents (46) occurred at the intersection of John Fitch Boulevard (Route 5) and Sullivan Avenue, with an average rate of 15.33 accidents per year. **Table 6** provides a summary of the study area accident history.

TABLE 6
ACCIDENT DATA SUMMARY (2019 - 2021)

INTERSECTION	NUMBER OF ACCIDENTS		SEVERITY			CONDITIONS			
	Total	Average Per Year	Property Damage Only	Personal Injury	Fatality	Clear (Dry)	Rain/Snow	Day	Night
Sullivan Ave & John Fitch Boulevard	46	15.33	31 (67%)	15 (33%)	0 (0%)	32 (70%)	14 (30%)	38 (83%)	8 (17%)
Sullivan Ave & Rye Street	8	2.67	4 (50%)	4 (50%)	0 (0%)	6 (75%)	2 (25%)	6 (75%)	2 (25%)
Sullivan Ave & Kennedy Road	4	1.33	2 (50%)	2 (50%)	0 (0%)	4 (100%)	0 (0%)	2 (50%)	2 (50%)
Sullivan Ave & Ayers Road	6	2.00	3 (50%)	3 (50%)	0 (0%)	6 (100%)	0 (0%)	5 (83%)	1 (17%)

Signal Warrant Analysis

A signal warrant analysis of the intersection of Sullivan Avenue (Route 194) and Kennedy Road was performed as part of this traffic study. The traffic volumes used as the basis of this analysis are from the traffic counts conducted in February 2022.

This analysis is based on criteria outlined in Chapter 4C of the Manual on Uniform Traffic Control Devices (MUTCD) and the anticipated traffic volumes at this location. All warrants were evaluated to determine whether the proposed conditions meet these warrants. Additionally, we evaluated the intersection under existing conditions to see if it currently warrants a signal today. **Table 7** depicts the analysis of Warrants 1, 2 and 3 under existing conditions, and **Table 8** depicts the analysis of Warrants 1, 2 and 3 under proposed conditions.

- Warrant 1 (Eight-Hour Vehicular Volume) states that volume thresholds must be met for one of two conditions, or a reduced combination of both conditions, for a period of eight hours on a given day.
- Warrant 2 (Four-Hour Vehicular Volume) is met if the plot point of the volumes (minor street higher-volume approach VPH versus major street total VPH) falls above a designated curve for four hours of a given day.
- Warrant 3 (Peak Hour) is satisfied if the plot point of the volumes of the peak hour falls above the designated curve.

The signal warrant analysis was conducted using one approach lane for the major street (Sullivan Avenue) and minor street (Kennedy Road) approaches. Automatic traffic recorder (ATR) counts were collected on the westbound approach (east of Kennedy Road) and the

southbound approach (north of Sullivan Avenue) to record weekday traffic conditions over 24 hours. The counts were conducted on a Wednesday in February 2022 and the two-way average daily traffic (ADT) on Sullivan Avenue was 10,232 vehicles-per-day (VPD). Sullivan Avenue eastbound experienced an ADT of 5,189 VPD and westbound experienced an ADT of 5,043 VPD.

**TABLE 7 - SIGNAL WARRANT SUMMARY – EXISTING CONDITIONS
NUMBER OF HOURS WARRANTS MET**

Location	Warrant 1, Eight-Hour Vehicular Volume (Condition A 100% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition B 100% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition A 80% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition B 80% Factor) Satisfied	Warrant 2 Four-Hour Vehicular Volume (100% Factor) Satisfied	Warrant 3 Peak Hour (100% Factor) Satisfied
Sullivan Avenue & Kennedy Road	5	11		6	11	7

**TABLE 8 - SIGNAL WARRANT SUMMARY – BUILD CONDITIONS
NUMBER OF HOURS WARRANTS MET**

Location	Warrant 1, Eight-Hour Vehicular Volume (Condition A 100% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition B 100% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition A 80% Factor) Satisfied	Warrant 1, Eight-Hour Vehicular Volume (Condition B 80% Factor) Satisfied	Warrant 2 Four-Hour Vehicular Volume (100% Factor) Satisfied	Warrant 3 Peak Hour (100% Factor) Satisfied
Sullivan Avenue & Kennedy Road	7	12		8	11	7

As shown in **Table 7**, 11 hours of Warrant 1 volumes were met under the existing conditions. As shown in **Table 8**, 12 hours of Warrant 1 volumes were met under the proposed conditions. Therefore, a traffic signal is warranted at this intersection under existing conditions, and with the anticipated increase in traffic volumes due to the development, a signal would also be warranted under the proposed conditions. As this intersection is on a state road, ConnDOT will review the intersection signal warrants. Details of the warrant analysis are included in **Appendix F**.

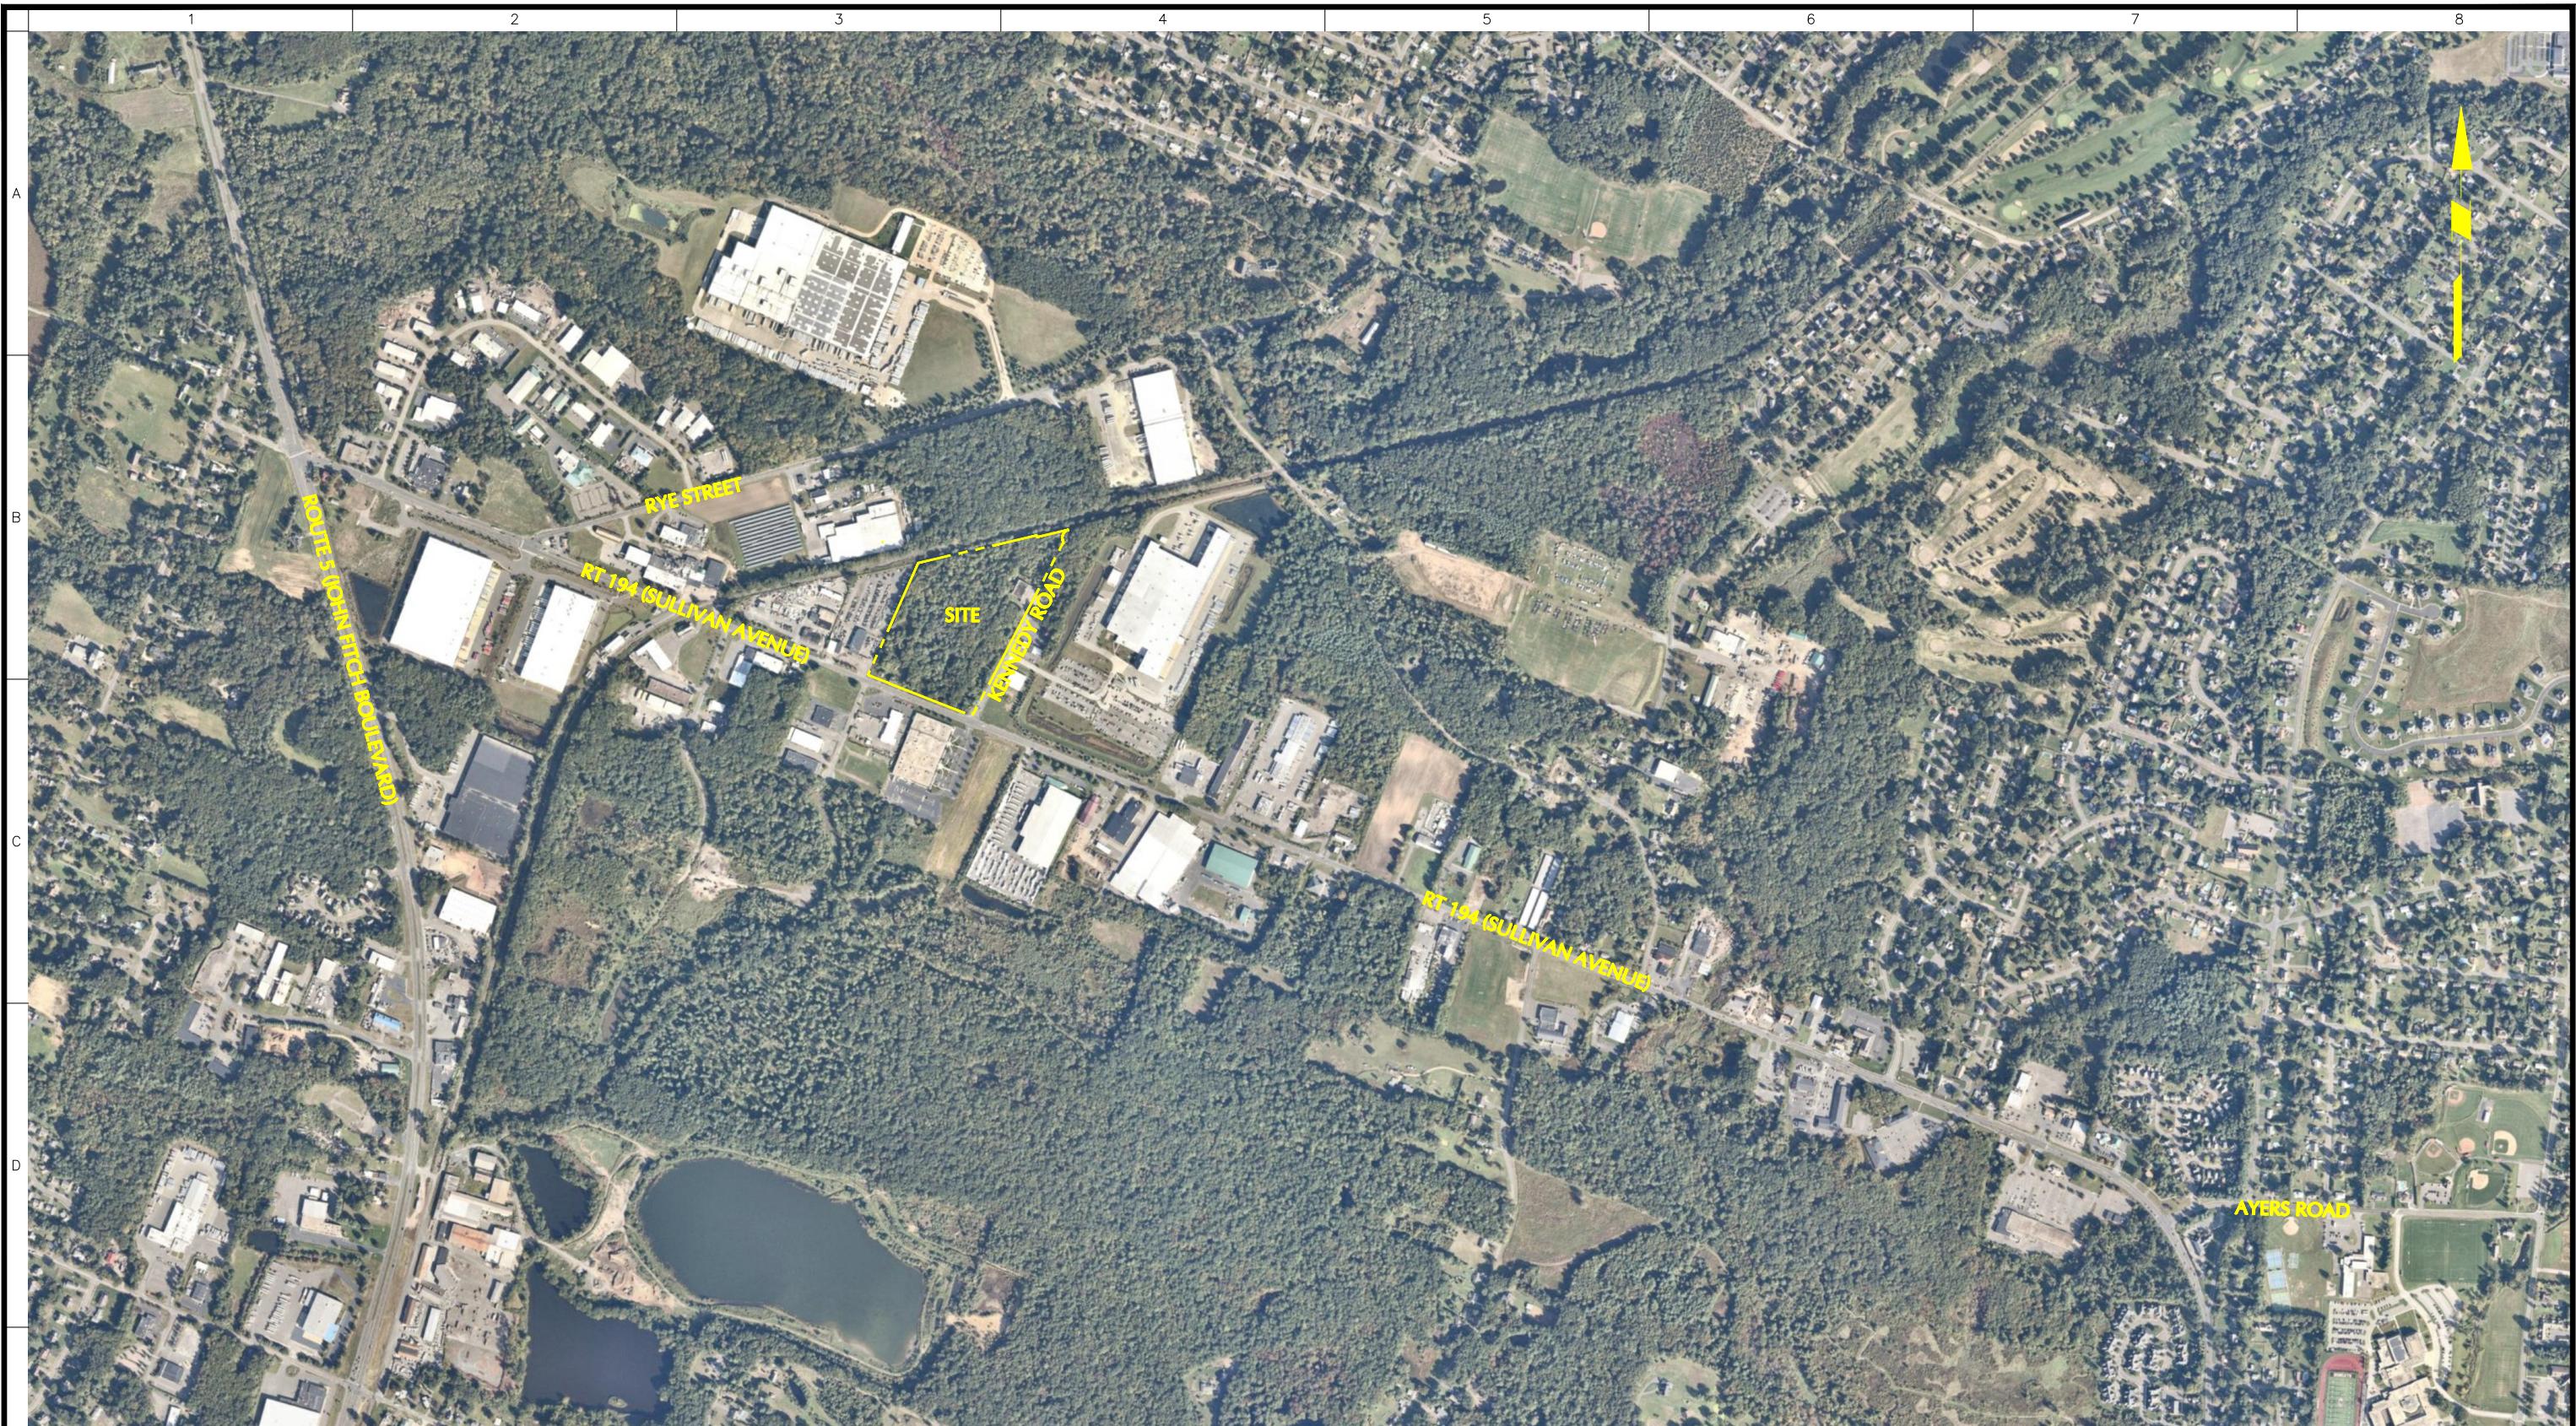

6.0 SUMMARY AND CONCLUSIONS

This evaluation identifies the potential traffic impacts generated by the proposed development on the surrounding area road network. We performed a capacity analysis for the existing, background, and build scenarios for four area roadway network intersections. Our evaluation indicates that, in general, the existing roadway infrastructure is adequate to support the nominal increase in traffic volume generated by the proposed warehouse development. Overall, the intersections analyzed will maintain acceptable or background traffic operating conditions. As part of this study, Langan conducted a signal warrant analysis at the intersection of Kennedy Road and Sullivan Avenue. Under existing conditions, this intersection warrants a traffic signal based on criteria outlined in Chapter 4C of the Manual on Uniform Traffic Control Devices (MUTCD). As would be expected, under build conditions, a signal would continue to be warranted. As this intersection is on a state road, ConnDOT will review the intersection signal warrants.

Appendix E

Trip Generation Analysis

Land Use: 150 Warehousing

Description

A warehouse is primarily devoted to the storage of materials, but it may also include office and maintenance areas. High-cube transload and short-term storage warehouse (Land Use 154), high-cube fulfillment center warehouse (Land Use 155), high-cube parcel hub warehouse (Land Use 156), and high-cube cold storage warehouse (Land Use 157) are related uses.

Additional Data

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in California, Connecticut, Minnesota, New Jersey, New York, Ohio, Oregon, Pennsylvania, and Texas.

Source Numbers

184, 331, 406, 411, 443, 579, 583, 596, 598, 611, 619, 642, 752, 869, 875, 876, 914, 940, 1050

Warehousing (150)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA
On a: Weekday

Setting/Location: General Urban/Suburban

Number of Studies: 31

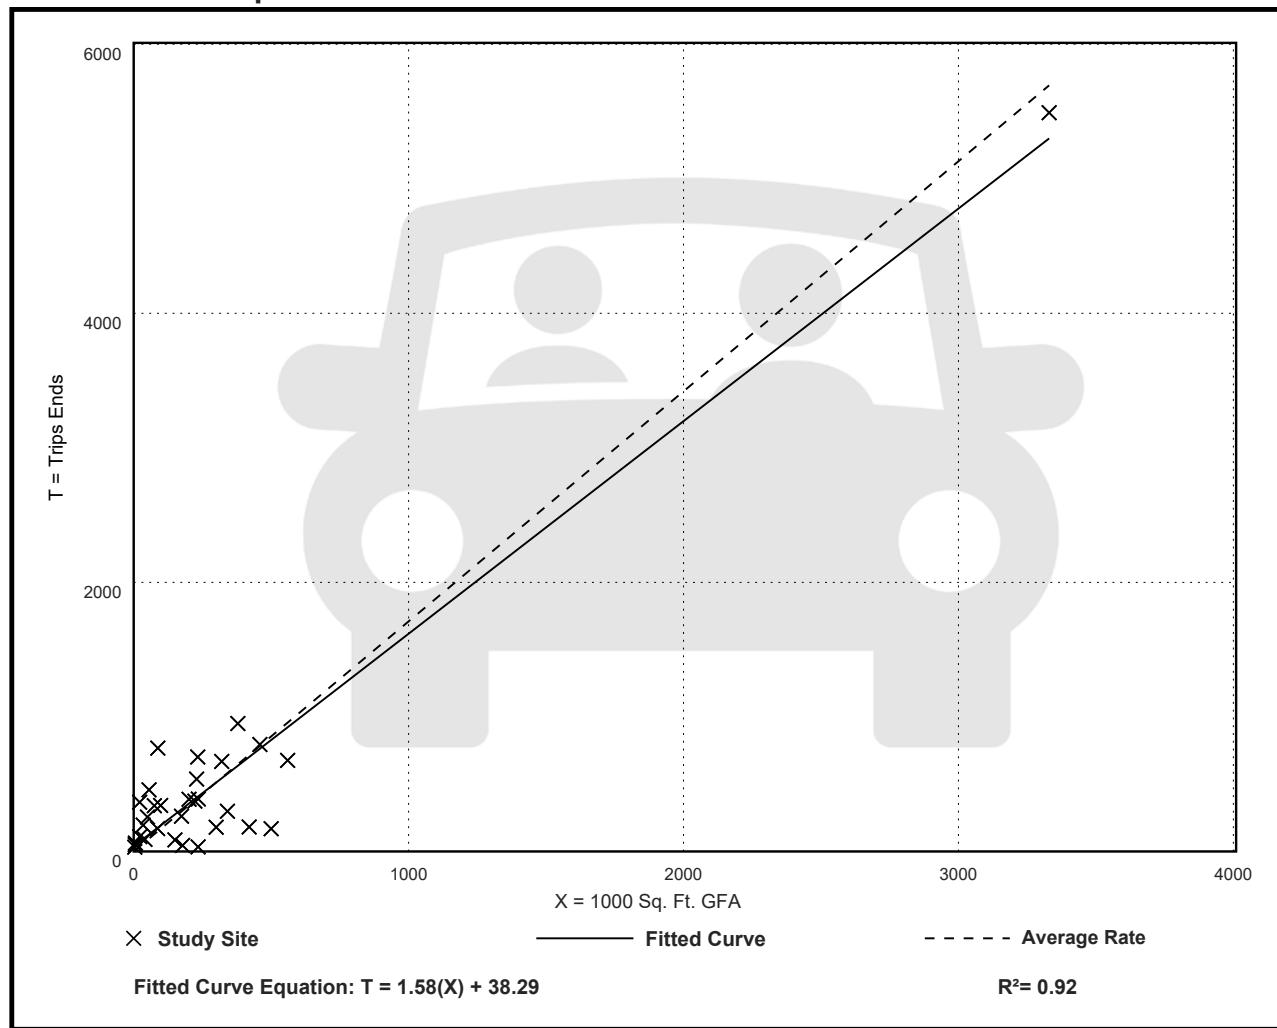

Avg. 1000 Sq. Ft. GFA: 292

Directional Distribution: 50% entering, 50% exiting

Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
1.71	0.15 - 16.93	1.48

Data Plot and Equation

$$\text{Trips} = 1.58 * (241.8) + 38.29 = 420 \text{ Total Trips}$$

Warehousing (150)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA

On a: Weekday,

Peak Hour of Adjacent Street Traffic,

One Hour Between 7 and 9 a.m.

Setting/Location: General Urban/Suburban

Number of Studies: 36

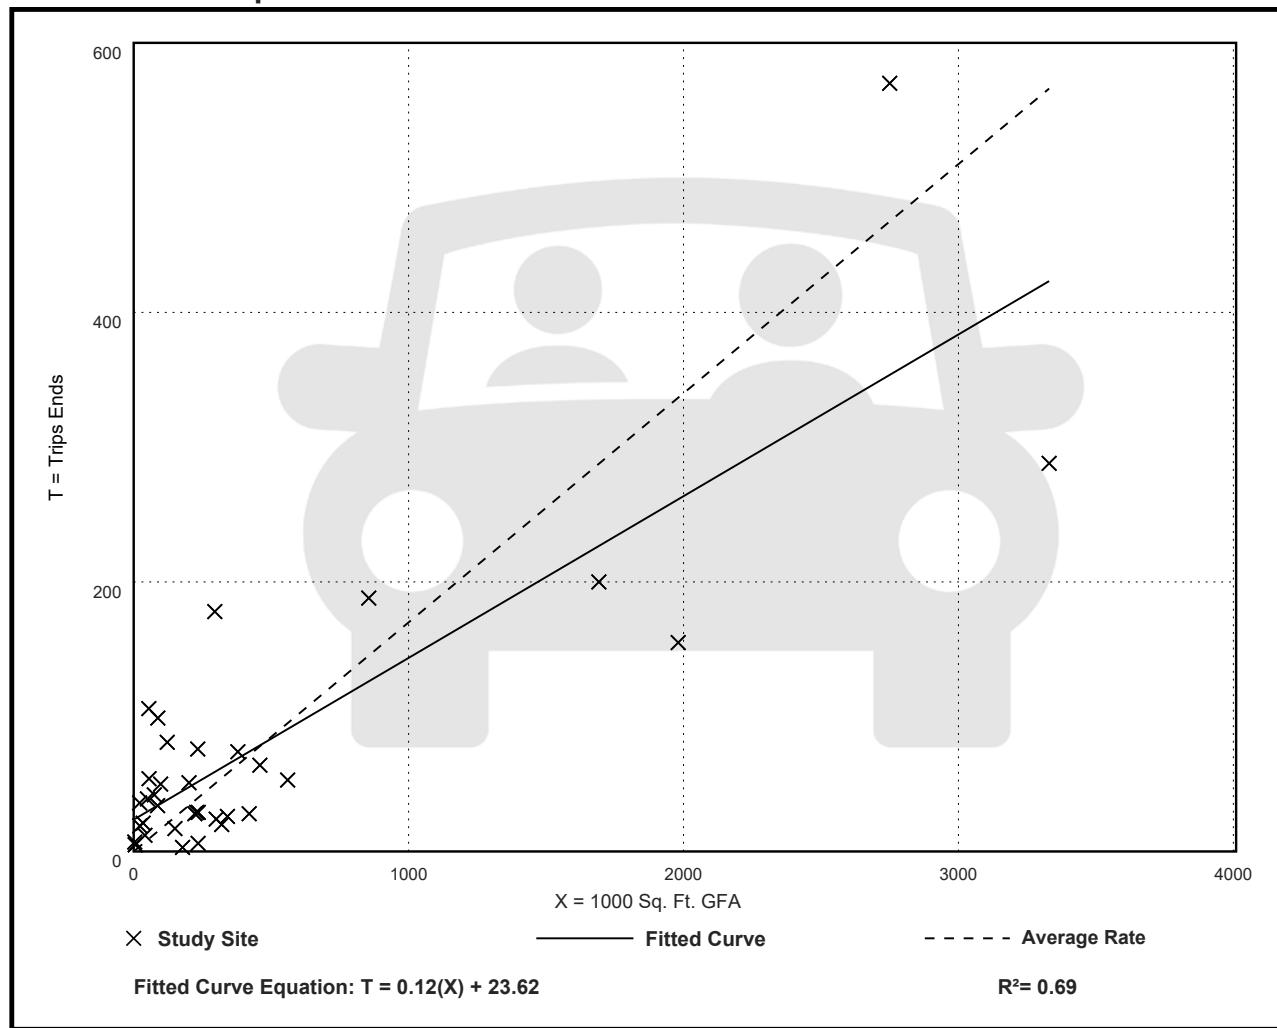

Avg. 1000 Sq. Ft. GFA: 448

Directional Distribution: 77% entering, 23% exiting

Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
0.17	0.02 - 1.93	0.19

Data Plot and Equation

$$\text{Trips} = 0.12 * (241.8) + 23.62 = 53 \text{ Total Trips}$$

Warehousing (150)

Vehicle Trip Ends vs: 1000 Sq. Ft. GFA

On a: Weekday,

Peak Hour of Adjacent Street Traffic,

One Hour Between 4 and 6 p.m.

Setting/Location: General Urban/Suburban

Number of Studies: 49

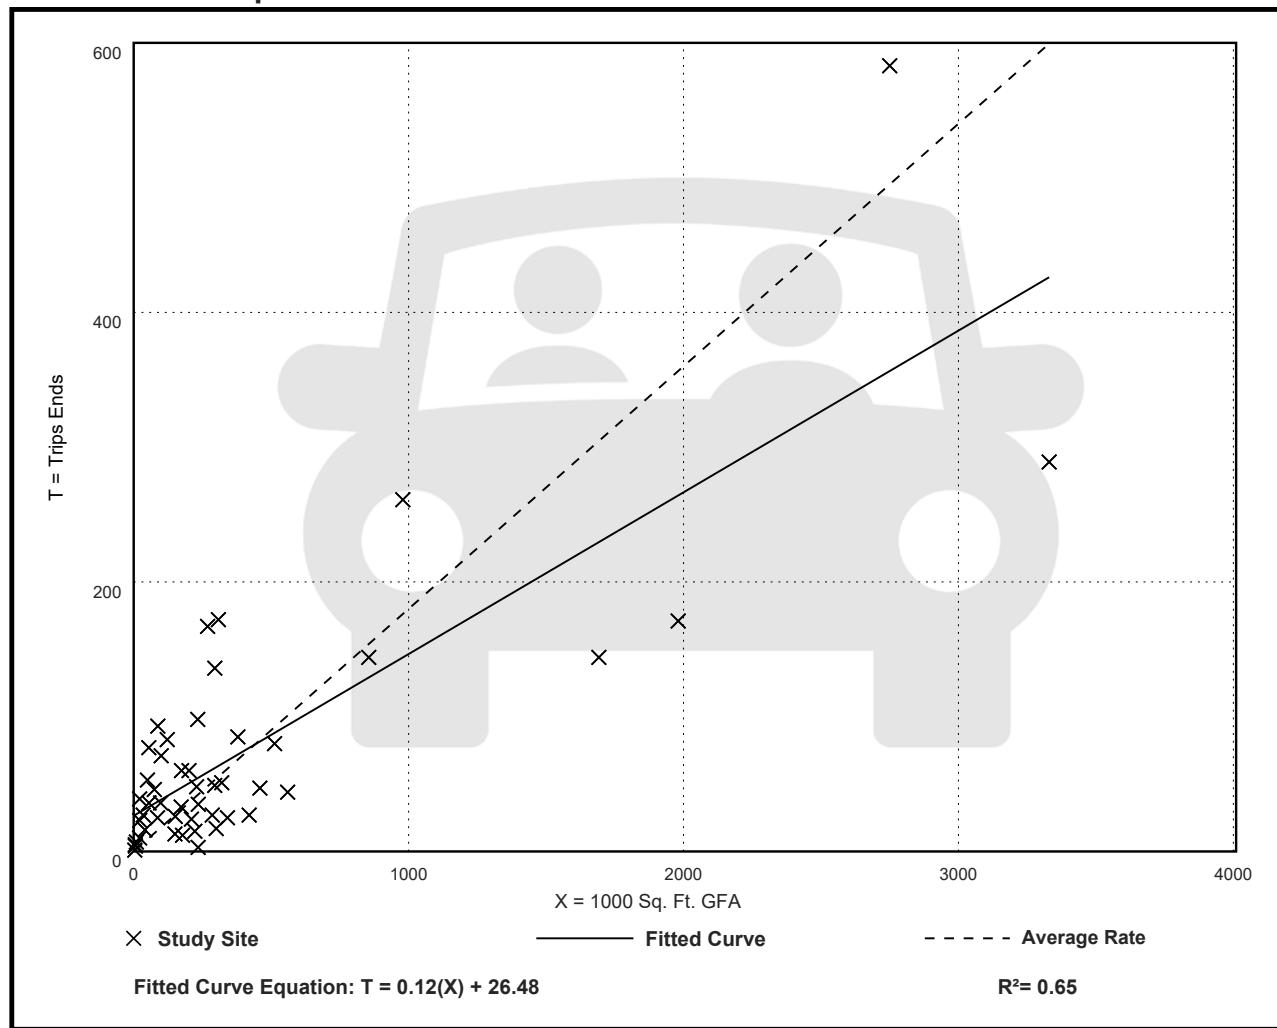

Avg. 1000 Sq. Ft. GFA: 400

Directional Distribution: 28% entering, 72% exiting

Vehicle Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
0.18	0.01 - 1.80	0.18

Data Plot and Equation

$$\text{Trips} = 0.12 * (241.8) + 24.68 = 55 \text{ Total Trips}$$

Warehousing (150)

Truck Trip Ends vs: 1000 Sq. Ft. GFA
On a: Weekday

Setting/Location: General Urban/Suburban

Number of Studies: 12

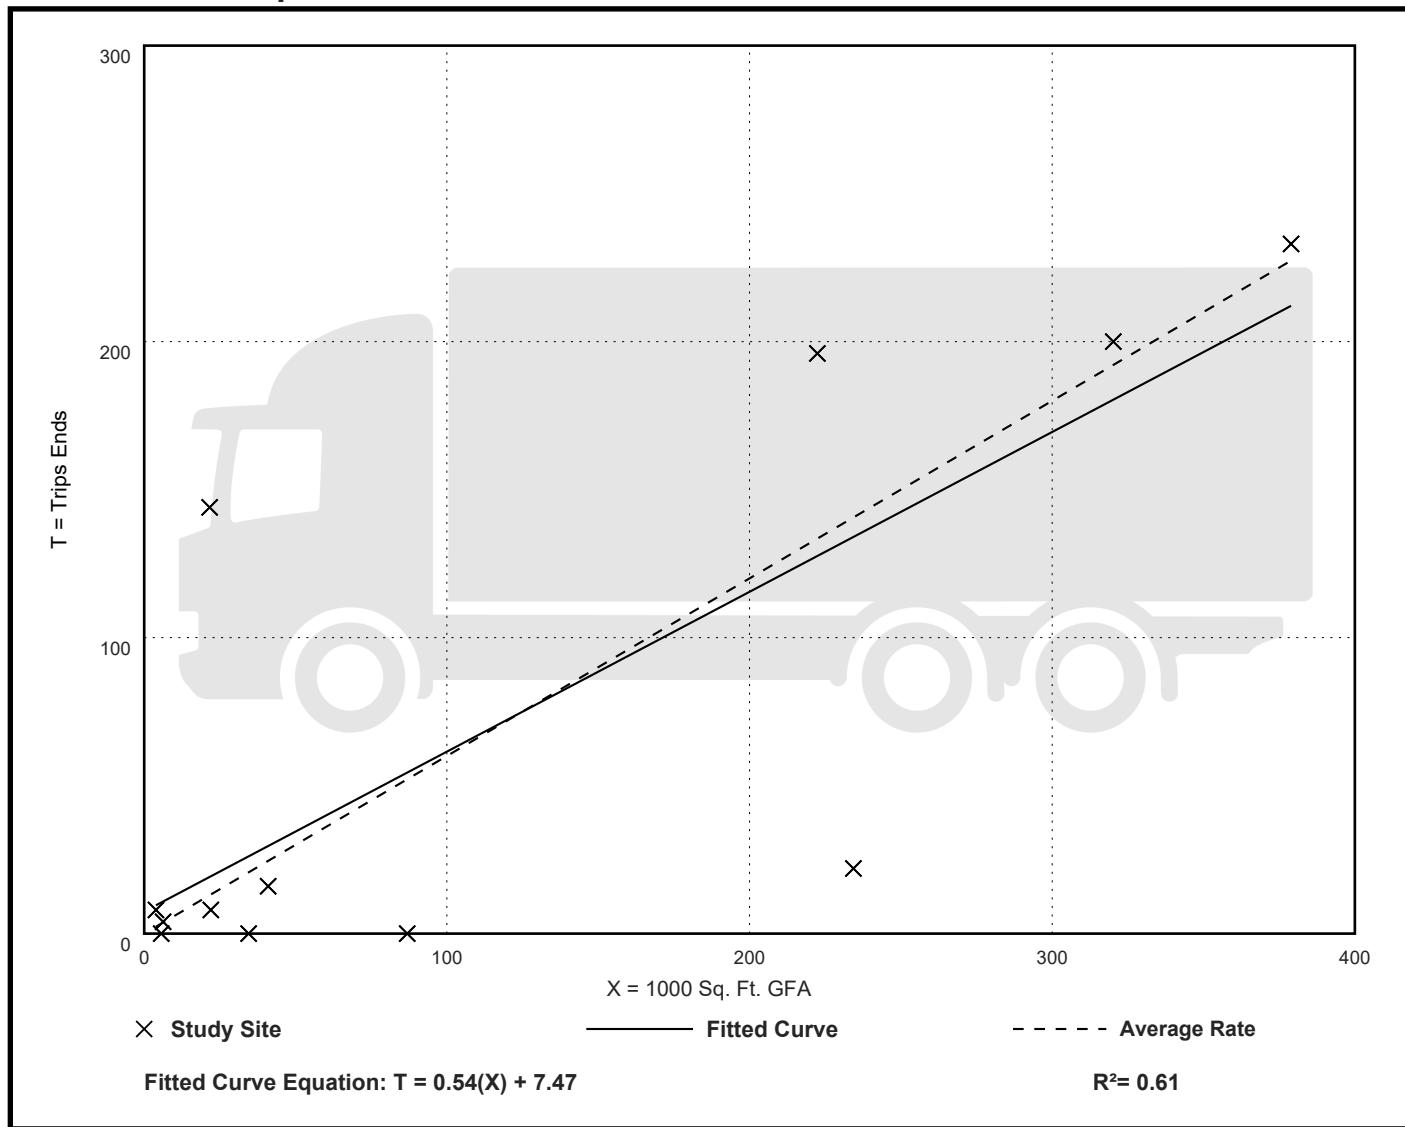

Avg. 1000 Sq. Ft. GFA: 115

Directional Distribution: 50% entering, 50% exiting

Truck Trip Generation per 1000 Sq. Ft. GFA

Average Rate	Range of Rates	Standard Deviation
0.60	0.00 - 6.66	0.86

Data Plot and Equation

$$\text{Truck Trips} = 0.54 * (241.8) + 7.47 = 138 \text{ Truck Trips}$$

Numbers of Hours Warrant Thresholds Exceeded:

7 12 8 11 7

Notes:

- 1) Existing volumes taken from counts collected by Traffic DataBank from 2/9/2022. A growth rate of 0.5% has been used to project 2022 volumes to 2023.
- 2) Trip Generation Entering Volumes were added to the 2022 Background Major Street Volumes to obtain the 2023 Build Major Street Volumes.
- 3) Trip Generation Exiting Volumes were added to the 2022 Background Minor Street Volumes to obtain the 2023 Build Minor Street Volumes.
- 2) As shown in the table above, the traffic volumes satisfy traffic signal warrants 1-3 outlined in the MUTCD guidelines.
