Project Summary

Mannarino Builders, Inc. proposes to construct a 13-Lot open space subdivision on Maskel Road and Abbe Road in South Windsor, Connecticut. 12.32 acres will be preserved as open space. Another 0.8 acres will be preserved by conservation easement. The development includes the extension of Maskel Road to Abbe Road and the construction of a stormwater collection, treatment and detention system including a stormwater pocket pond. This report analyzes the performance of this stormwater system and demonstrates compliance with the Town's public improvement specifications for stormwater design.

Property

The subject parcel includes two lots totally 21.58 acres north of the Maskel Road cul-de-sac and east of Abbe Road. The subject parcel has frontage on both Maskel Road and Abbe Road. The property contains an intermittent watercourse in the northeast corner identified as Dry Brook. The parcel also contains an isolated wetland (8,866 s.f.) along the western boundary. A 175' wide utility pole easement runs north and south along the east side of Maskel Road. The parcel slopes from east to west to the isolated wetland and then into a drainage ditch along the northern boundary where it discharges to the town drainage system in Abbe Road.

Soil Evaluation

The Web Soil Survey identifies the on-site soils as primarily Wapping Very Fine Sandy Loam, which is classified as HSG C soil. The soils survey and descriptions are attached to the Appendix C of this report.

Hydraulic & Hydrologic Calculations

A stormwater pocket pond is proposed to provide treatment and detention of stormwater. The performance of the basin was analyzed using the SCS Unit Hydrograph Method and HydroCAD 10.00 software. The attached report details the results of this analysis. Rainfall depth for the 100, 25, 10 and 2-year design storms were taken from online NOAA Rainfall Data (Appendix C). Hydrographs for these storms were generated using a Type III, 24-hour rainfall and routed through the prosed basin.

Runoff curve numbers were initially selected for pre-development and post-development conditions assuming HSG C soils. These curve numbers produced higher peak flow rates than

expected for pre-development conditions. Using typical C soil CN values for woods (70) produces a 10-year predevelopment peak flow of 9.98 cfs. The runoff from the site collects in a 15" ACCMP pipe on Abbe Road which does not have capacity for this flow. The Town Engineer was not aware of any reports of flooding at Abbe Road so it is unlikely this rate is reflective of actual conditions. Another indication that the typical C soil CN values are too high for this site is that a Rational Method analysis also produces lower peak rates. In accordance with the Town's guidelines we prepared a Rational Method analysis of the roadway pipe network for initial pipe sizing purposes. This analysis produced a 10-year peak discharge to the stormwater basin of 9.2 cfs. Using the typical C soil CN values produces a peak flow of 13.03 cfs to the basin, an inconsistent result. To calibrate the hydrologic model, we selected CN values between the typical B and C soils as follows:

Table 1 – CN Value Comparison

Description	B-Soils	C-Soils	Calibrated Soils
Woods	55	70	61
Lawn	61	74	67
Wetlands (D soil)			77
Impervious	98	98	98

Using the calibrated CN values, the peak flows for predevelopment conditions were reduced from 9.98 cfs to 6.62 cfs which is more consistent with the observed conditions downstream. It also imposes a stricter limitation on discharge from the development. Using the calibrated CN values and an equivalent Tc produced a peak flow of 11.40 which matches the Rational Method analysis. This indicates the selected CN values are appropriate.

Time of concentration for the existing conditions was calculated using sheet flow, shallow concentrated flow and open channel flow for the most remove travel path within each watershed. Since time of concentration is greatly influenced by sheet flow, we conservatively assumed a much longer sheet flow for existing conditions than for proposed conditions. Time of concentration for the smaller watersheds to each drainage structure were assumed to be 5 minutes for mostly paved areas and 10 minutes for mostly lawn areas. This is consistent with CT DOT Drainage Manual practices. The flow path for Tc calculation is depicted on the attached Pre and Post Development Drainage Area Maps in Appendix A&B.

Pipes were sized for the 10-year storm to maintain at least 12" of freeboard below the structure top of frame. The Rational Method Pipe Sizing Chart comparing 10-year flow to pipe full flow capacity is attached for reference in Appendix E. But the HydroCAD report in Appendix D provides a comprehensive hydraulic grade analysis of the pipe system. Watershed areas for

each structure are depicted on the attached Post Development Drainage Area Map in Appendix B. To demonstrate compliance with the minimum freeboard requirement, the hydraulic analysis from the HydroCAD report is summarized in table 2 below.

Table 2 – Hydraulic Grade Line Analysis (10-Year Storm)

STR#	TF	HGL	Freeboard
YD#1	313.00	306.64	6.36
YD#2	309.38	306.24	3.14
YD#3	308.38	305.38	3.00

DMH#1	299.00	296.52	2.48
DMH#2	299.50	290.33	9.17
YD#8	290.50	287.39	3.11
CB#9	290.76	287.39	3.37
CB#10	290.76	287.39	3.37

Water Quality Treatment

The stormwater pond includes a permanent pool below the outlet elevation (294.0) which provides for removal of total suspended solids (TSS) through settlement. A sediment forebay is provided at the pipe inlet for pre-treatment. An aquatic bench is provided between the forebay and permanent pool to provide additional filtration and pollutant removal. The permanent pool is sized to meet or exceed the minimum water quality volume as defined by the CT DEP Stormwater Quality Manual. While not all the site follows through the treatment basin, we have maximized the treated area to the maximum extent practicable and conservatively calculated the WQV based on the entire site. The required WQV is computed as follows:

$$WQV = (1") [0.05 + 0.009(I)] (A)/12 \times 43,560$$

Where,

$$I = \text{Impervious Coverage (\%)} = 19.64\%$$

$$A = \text{Watershed Area (ac.)} = 7.648 \text{ ac.}$$

Therefore,

$$WQV = (1") [0.05 + 0.009(19.64)] (7.648)/12 \times 43,560 = 6,295 \text{ c.f.}$$

The proposed pond has a permanent pool volume of 7,651 c.f. below the outlet elevation 294.0, which exceeds the minimum required volume.

A portion of this permanent pool storage is provided in the forebay which is designed to trap coarse sediment prior to discharge to the rest of the pond. The forebay should contain at least 10% of the WQV or 630 c.f. The forebay has a capacity of 2,021 c.f. below elevation 293.5.

The surplus storage capacity in the forebay provides ample room for sediment storage.

Hydrographs for the proposed watershed areas were routed through the pond and outlet pipe to determine post-development discharge rates and compare to existing rate. The pre and post development analysis from the HydroCAD report are summarized in Table 3 below.

Table 3 – Pre & Post Development Peak Flow Rates (cfs)

Storm	Pre Q	Post Q
2-year	1.43	1.07
10-year	6.22	5.18
25-year	10.03	8.70
100-year	16.66	13.27

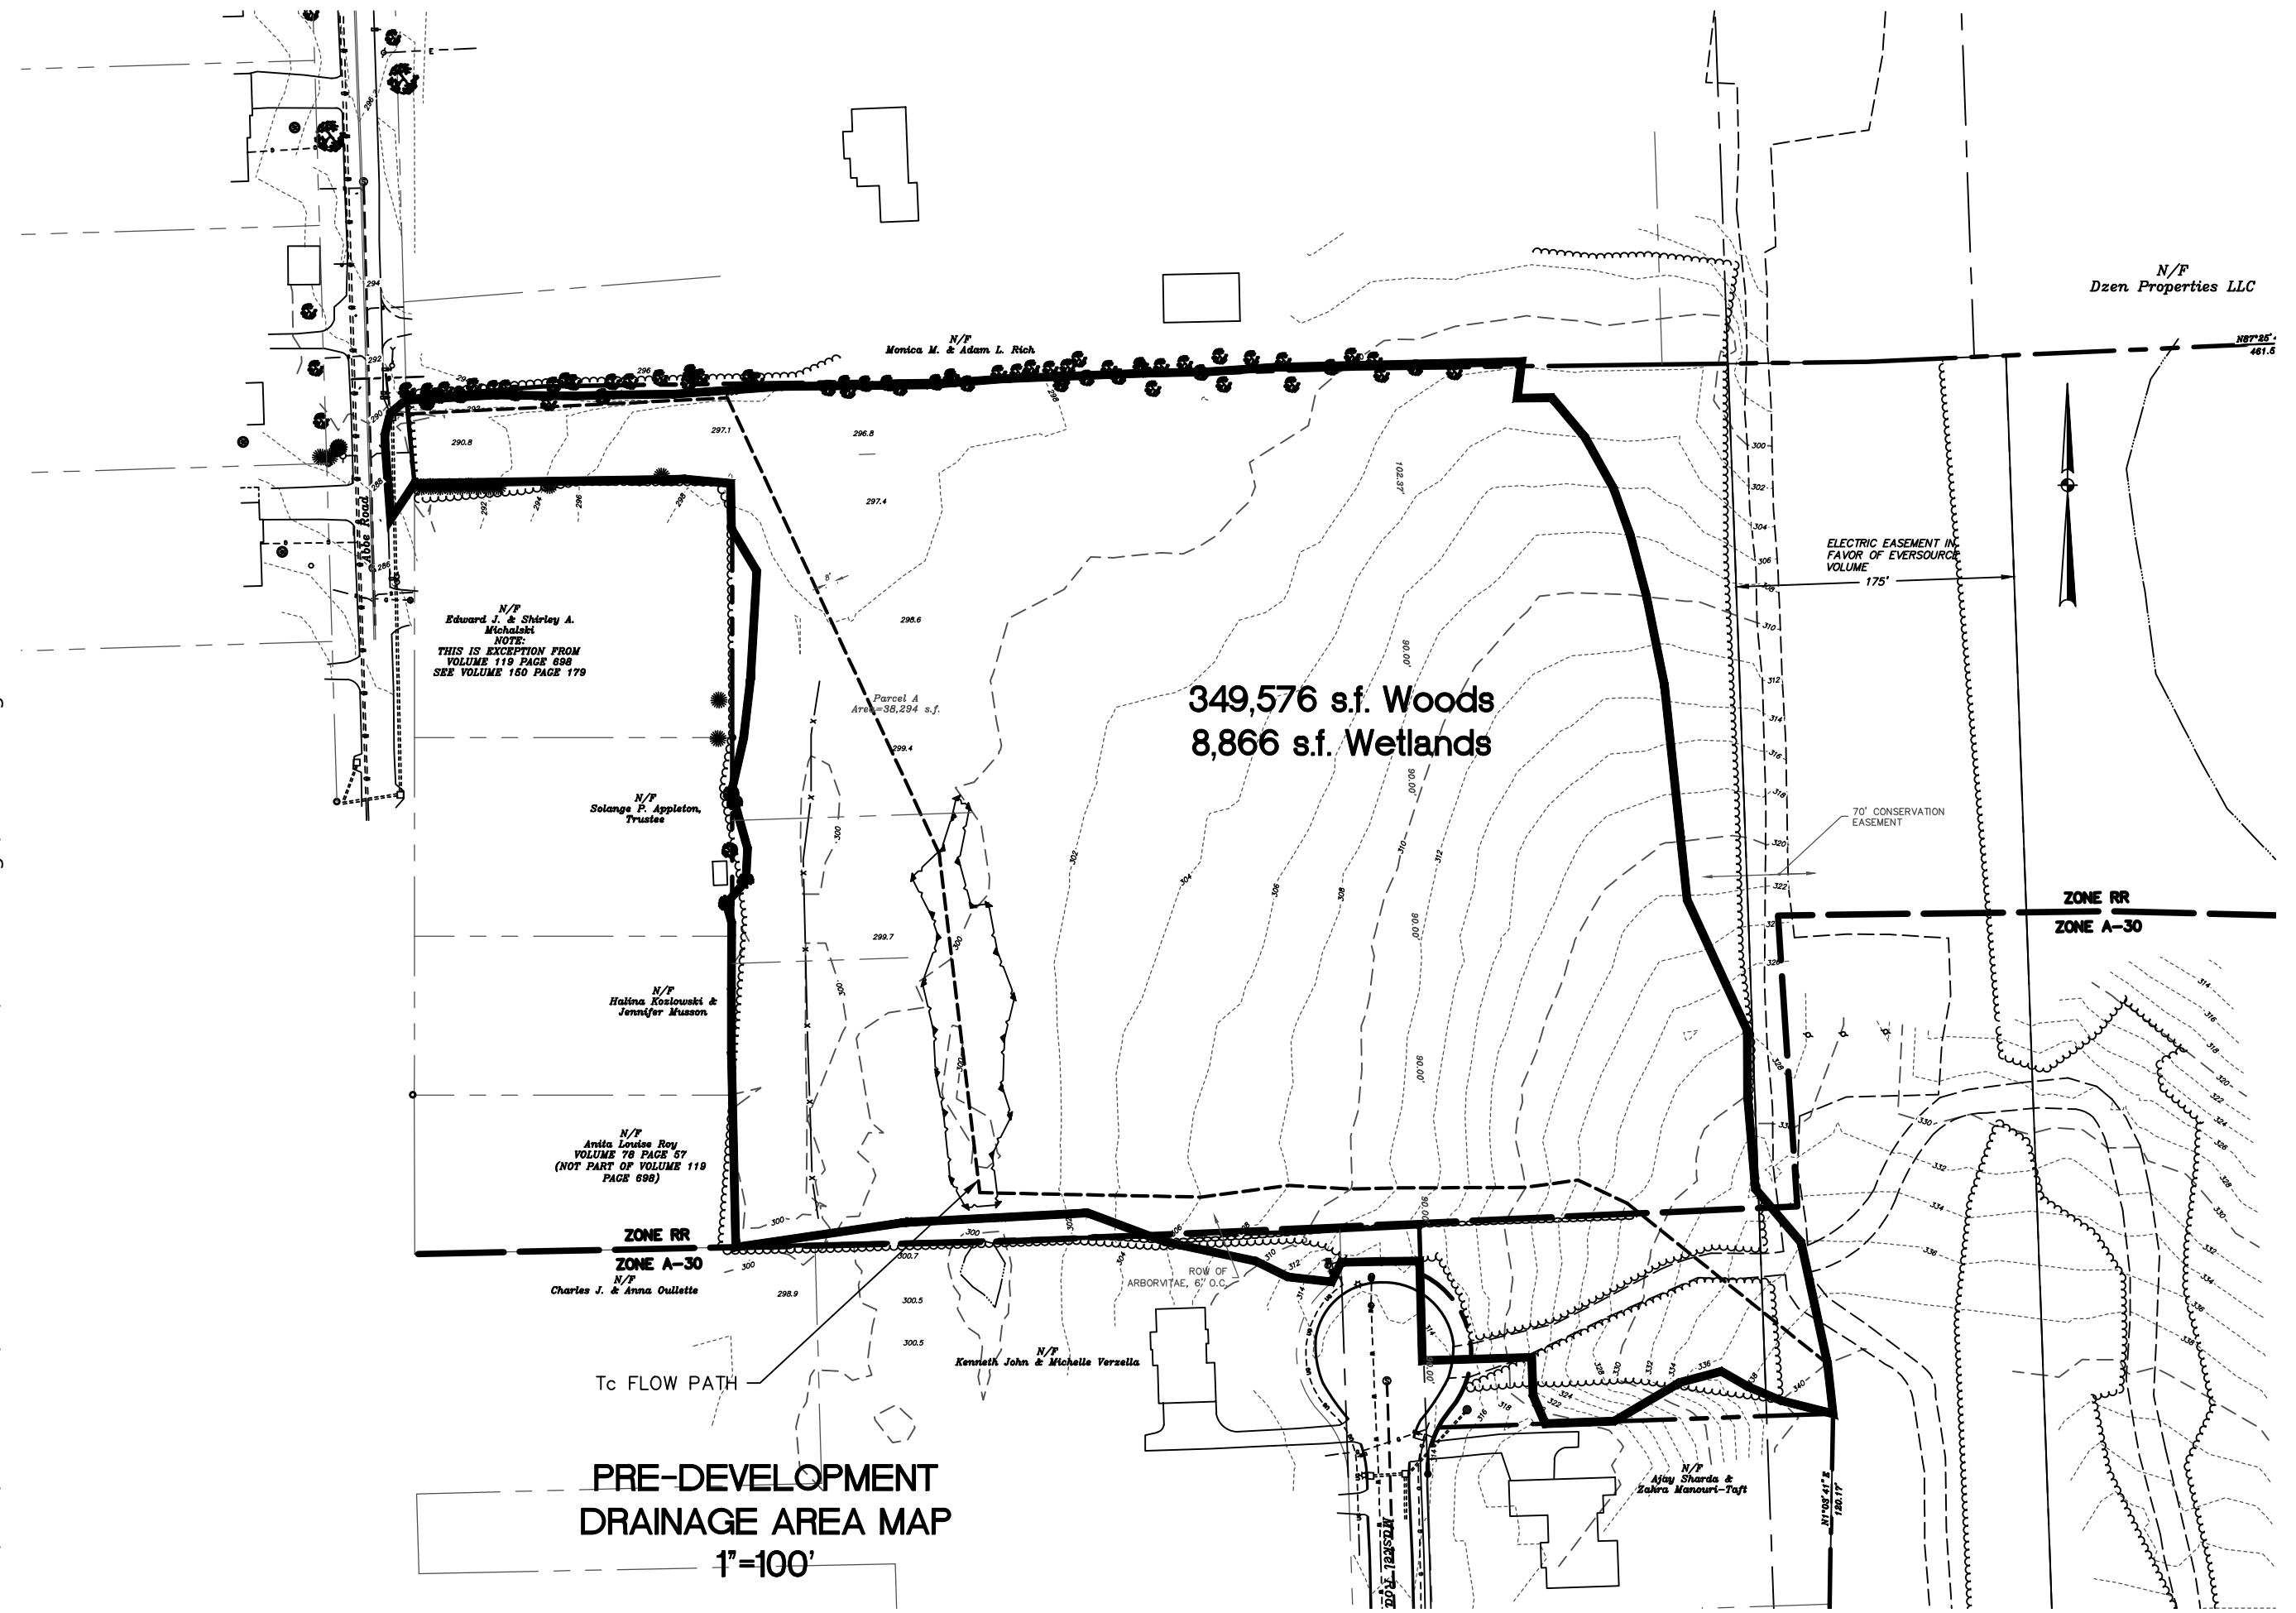

This analysis demonstrates that the prosed development will not increase peak flow rates to the town drainage system in Abbe Road.

Conclusion

Based on this analysis, it is our professional opinion that the proposed development will not adversely impact downstream properties. Stormwater will be adequate treated for TSS and other pollutants. Peak rates will not increase.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut

Survey Area Data: Version 18, Dec 6, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 27, 2016—Oct 30, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
6	Wilbraham and Menlo soils, 0 to 8 percent slopes, extremely stony	0.0	0.1%
53A	Wapping very fine sandy loam, 0 to 3 percent slopes	0.4	3.4%
54B	Wapping very fine sandy loam, 2 to 8 percent slopes, very stony	6.2	51.7%
66B	Narragansett silt loam, 2 to 8 percent slopes	3.9	32.1%
67B	Narragansett silt loam, 3 to 8 percent slopes, very stony	1.5	12.7%
Totals for Area of Interest		12.1	100.0%

State of Connecticut

66B—Narragansett silt loam, 2 to 8 percent slopes

Map Unit Setting

National map unit symbol: 9lq3

Elevation: 0 to 1,200 feet

Mean annual precipitation: 43 to 54 inches

Mean annual air temperature: 45 to 55 degrees F

Frost-free period: 140 to 185 days

Farmland classification: All areas are prime farmland

Map Unit Composition

Narragansett and similar soils: 80 percent

Minor components: 20 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Narragansett

Setting

Landform: Hills, till plains

Down-slope shape: Linear

Across-slope shape: Convex

Parent material: Coarse-loamy eolian deposits over sandy and gravelly melt-out till derived from gneiss and/or schist and/or sandstone and shale

Typical profile

Ap - 0 to 6 inches: silt loam

Bw1 - 6 to 15 inches: silt loam

Bw2 - 15 to 24 inches: silt loam

Bw3 - 24 to 28 inches: gravelly silt loam

2C - 28 to 60 inches: very gravelly loamy coarse sand

Properties and qualities

Slope: 2 to 8 percent

Depth to restrictive feature: More than 80 inches

Natural drainage class: Well drained

Runoff class: Low

Capacity of the most limiting layer to transmit water (Ksat):

Moderately high to high (0.57 to 1.98 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Available water storage in profile: Moderate (about 6.3 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 2e

Hydrologic Soil Group: B

Hydric soil rating: No

Minor Components

Broadbrook

Percent of map unit: 5 percent
Landform: Drumlins, hills, till plains
Down-slope shape: Linear
Across-slope shape: Concave
Hydric soil rating: No

Charlton

Percent of map unit: 5 percent
Landform: Hills
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Leicester

Percent of map unit: 3 percent
Landform: Depressions, drainageways
Down-slope shape: Linear
Across-slope shape: Concave
Hydric soil rating: Yes

Unnamed, red parent material

Percent of map unit: 2 percent
Hydric soil rating: No

Canton

Percent of map unit: 2 percent
Landform: Hills
Down-slope shape: Linear
Across-slope shape: Convex
Hydric soil rating: No

Wapping

Percent of map unit: 2 percent
Landform: Hills, till plains
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Sutton

Percent of map unit: 1 percent
Landform: Depressions, drainageways
Down-slope shape: Concave
Across-slope shape: Linear
Hydric soil rating: No

Data Source Information

Soil Survey Area: State of Connecticut
Survey Area Data: Version 18, Dec 6, 2018

State of Connecticut

6—Wilbraham and Menlo soils, 0 to 8 percent slopes, extremely stony

Map Unit Setting

National map unit symbol: 2wh25

Elevation: 0 to 790 feet

Mean annual precipitation: 36 to 53 inches

Mean annual air temperature: 41 to 54 degrees F

Frost-free period: 140 to 220 days

Farmland classification: Not prime farmland

Map Unit Composition

Wilbraham, extremely stony, and similar soils: 60 percent

Menlo, extremely stony, and similar soils: 30 percent

Minor components: 10 percent

*Estimates are based on observations, descriptions, and transects of
the mapunit.*

Description of Wilbraham, Extremely Stony

Setting

Landform: Ground moraines, drumlins, hills, drainageways,
depressions

Landform position (two-dimensional): Toeslope, footslope

Landform position (three-dimensional): Head slope, base slope

Down-slope shape: Concave

Across-slope shape: Concave

Parent material: Red coarse-loamy lodgment till derived from
basalt and/or sandstone and shale

Typical profile

Oe - 0 to 2 inches: moderately decomposed plant material

Ap - 2 to 10 inches: silt loam

Bw1 - 10 to 21 inches: silt loam

Bw2 - 21 to 27 inches: silt loam

Cd - 27 to 63 inches: gravelly loam

Properties and qualities

Slope: 0 to 8 percent

Percent of area covered with surface fragments: 9.0 percent

Depth to restrictive feature: 16 to 35 inches to densic material

Natural drainage class: Poorly drained

Runoff class: Low

Capacity of the most limiting layer to transmit water (Ksat): Very
low to moderately low (0.00 to 0.14 in/hr)

Depth to water table: About 0 to 10 inches

Frequency of flooding: None

Frequency of ponding: None

Salinity, maximum in profile: Nonsaline (0.0 to 1.9 mmhos/cm)

Available water storage in profile: Low (about 5.9 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 7s

Hydrologic Soil Group: C/D

Hydric soil rating: Yes

Description of Menlo, Extremely Stony

Setting

Landform: Drainageways, depressions

Down-slope shape: Concave

Across-slope shape: Concave

Parent material: Coarse-loamy lodgment till derived from basalt
and/or sandstone and shale

Typical profile

Oa - 0 to 5 inches: highly decomposed plant material

A - 5 to 16 inches: mucky silt loam

Bg1 - 16 to 22 inches: flaggy very fine sandy loam

Bg2 - 22 to 27 inches: flaggy fine sandy loam

Cd1 - 27 to 40 inches: fine sandy loam

Cd2 - 40 to 60 inches: fine sandy loam

Properties and qualities

Slope: 0 to 8 percent

Percent of area covered with surface fragments: 9.0 percent

Depth to restrictive feature: 20 to 36 inches to densic material

Natural drainage class: Very poorly drained

Runoff class: Low

Capacity of the most limiting layer to transmit water (Ksat): Very
low to moderately high (0.00 to 0.20 in/hr)

Depth to water table: About 0 to 12 inches

Frequency of flooding: None

Frequency of ponding: Frequent

Available water storage in profile: Low (about 4.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 7s

Hydrologic Soil Group: C/D

Hydric soil rating: Yes

Minor Components

Watchaug

Percent of map unit: 5 percent

Landform: Ground moraines, hills

Landform position (two-dimensional): Backslope, footslope

Landform position (three-dimensional): Side slope

Down-slope shape: Linear

Across-slope shape: Concave

Hydric soil rating: No

Ludlow

Percent of map unit: 5 percent

Landform: Hills, drumlins

Landform position (two-dimensional): Summit, footslope,
backslope

Landform position (three-dimensional): Crest, side slope

Down-slope shape: Concave

Across-slope shape: Linear

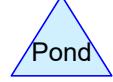

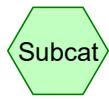

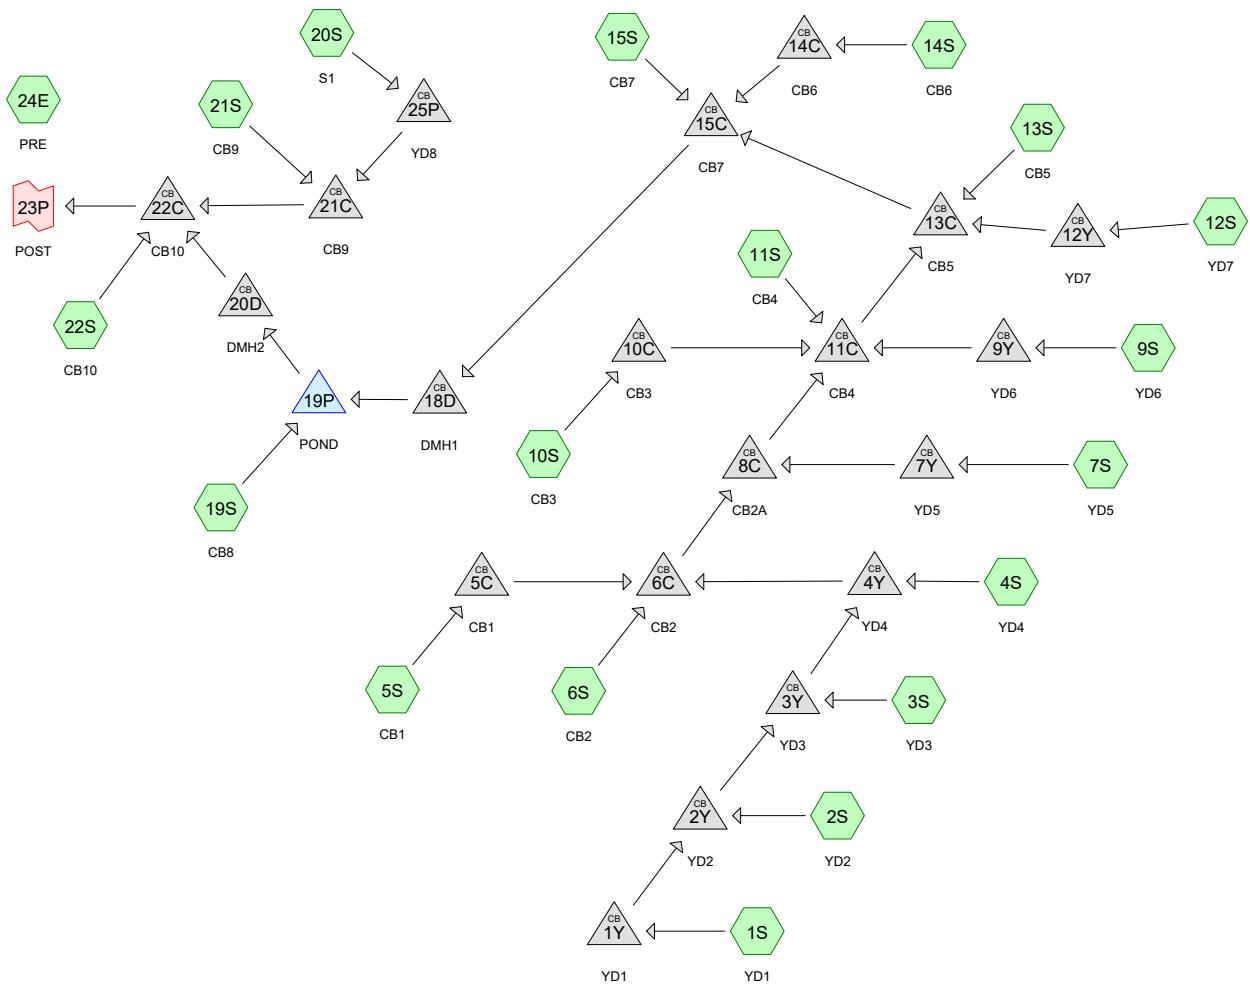

Hydric soil rating: No
