EXECUTIVE SUMMARY

Langan has prepared this traffic impact study to identify the potential impacts of the proposed warehouse at 25 Talbot Lane in South Windsor, Connecticut (See Figure 1). The project site is approximately 30.37-acres of vacant land.

The project includes the construction of a ±360,000 square-foot warehouse with approximately 318 car parking spaces, 59 trailer spaces, 30 tractor-trailer queuing spaces and 54 loading docks and associated site improvements (See Site Plan in Appendix A). The proposed development will be served by a full movement driveway connection to each Talbot Lane and Governor's Highway. The driveway connection to Governor's Highway will operate as a stop-controlled intersection for passenger vehicles only. The driveway to Talbot Lane will be stop-controlled for truck-traffic only. The site has been designed to enforce the exclusive use of these driveways by locating all trailer spaces and loading docks west of the proposed building and all passenger vehicles parking spaces east of the proposed building. The proposed development is anticipated to be in operation in 2023. All tractor-trailer truck traffic from the facility will be directed to only travel west on Governor's Highway to comply with the town's restriction of truck traffic on Governor's Highway east of Talbot Lane. In addition, the development will install clear signage along Talbot Lane indicating no tractor-trailer truck can use Governor's Highway east of Talbot Lane.

Langan used the Institute of Transportation Engineers (ITE) land-use code 156 to develop the trip generation for the proposed warehouse and site use. These trip generation volumes were used to evaluate the peak-hour and average daily traffic (ADT) for the 2023 build-year traffic operations conditions

Video turning-movement and vehicle-classification were conducted in December 2021, while schools were in session, at three intersections and used as a basis for this evaluation. The existing roadway infrastructure is adequate to support the nominal increase in traffic volume generated by the proposed warehouse development. No improvements are required or recommended at this time; signal timing optimization at the intersection of Route 5 and Governors Highway can improve signal operations in the future as needed.

The proposed driveway connection to Governor's Highway an Talbot Lane expected to operate with an acceptable Level of Service (LOS) during the morning and afternoon peak-hours build conditions.

1.0 INTRODUCTION

Langan has prepared this traffic impact study to identify the potential impacts of the proposed warehouse at 25 Talbot Lane in South Windsor, Connecticut (See Figure 1 for the Location Map). The 30.37-acre vacant site is on the southeast corner of Governor's Highway and Talbot Lane. Commercial uses exist to the west and north of the development site, with residential areas to the east and south.

The proposed warehouse development will include a ±360,000 square-foot building with approximately 318 car parking spaces, 59 trailer spaces, 30 tractor-trailer queuing spaces and 54 loading docks and associated landscaping, utility improvements and stormwater systems (See Site Plan in Appendix A). The proposed development is anticipated to be in operation in 2023.

2.0 SITE ACCESS AND STUDY LOCATIONS

Site Access

The proposed development will have a driveway connection to each Talbot Lane and Governor's Highway. Both driveways will operate as full-movement stop-controlled driveways. The driveway at Governor's Highway will be the project's main driveway connection for passenger vehicles. The driveway connection to Talbot Lane will be a stop-controlled driveway for truck-traffic only. The site has been designed to enforce the exclusive use of these driveways by locating all trailer spaces and loading docks west of the proposed building and all passenger vehicles parking spaces east of the proposed building. (See Site Plan in Appendix A). Governor's Highway has a truck traffic restriction from Talbot Lane to Ellington Road issued by the Town of South Windsor under ordinance #172. The development will install clear signage at both driveways along Talbot Lane indicating no tractor-trailer truck can use Governor's Highway east of Talbot Lane.

Study Locations

Three key intersections were evaluated in this study (See Figure 2).

- John Fitch Boulevard (US-5) and Governor's Highway
- Talbot Lane and Governor's Highway
- Ellington Road (SR-30) and Governor's Highway/ Podunk Circle

This study will evaluate traffic impacts of the facility's peak-hours on these intersections and the area roadway network.

3.0 EXISTING CONDITIONS

Area Roadway Network

John Fitch Boulevard (U.S. Route 5) is a four lane, north-south major highway under state jurisdiction. The north and south lanes are separated by a 25-foot wide grassy median with guardrails. *U.S. Route 5* provides two 12-foot wide travel lanes in each direction, with a 6-foot shoulder that varies along the length of the road on the outside of each travel lane, with a posted speed limit of 50 MPH.

Governor's Highway is a two lane, east-west, urban major collector road under local jurisdiction, with a posted speed limit of 30 MPH. Governor's Highway provides two 12-foot wide travel lanes and a 3-foot shoulder in each direction that varies along the length of the road. Governor's Highway transitions into a two-lane road without a shoulder and a 25 MPH posted speed limit between Talbot Lane and Ellington Road, which was designed to support the residential uses east of the development site. The roadway segment of Governor's Highway between Talbot Lane and US-5 was designed to support the commercial and industrial uses located on this area, and its pavement was restored in 2019 to support the truck traffic of this roadway segment.

Ellington Road (State Road 30) is a two lane, northeast-southwest, undivided, major highway under state jurisdiction, with a posted speed limit of 40 MPH. Ellington Road provides two 12-foot wide travel lanes in each direction, with 6-foot wide shoulders on the outside of each travel lane.

Podunk Circle is a two lane, north-south, local private road, that operates as the main access for residential lots.

Study Intersections

John Fitch Boulevard and Governor's Highway is a signalized four way intersection with the following geometry:

- Governor's Highway – one shared right-turn/left-turn/thru lane on both sides of intersection.
- Southbound John Fitch Boulevard – one shared right-turn/thru lane, one left-turn lane with approximately 260 feet of storage and one thru lane.
- Northbound John Fitch Boulevard - one left turn lane with approximately 260 feet of storage, one right-turn lane with approximately 280 feet of storage and two thru lane.

Talbot Lane and Governor's Highway is a stop-sign controlled "T" intersection with the following geometry:

- Talbot Lane – one shared right-turn/left-turn lane.
- Governor's Highway Eastbound – one shared right-turn/thru lane.
- Governor's Highway Westbound – one shared left-turn/thru lane.

Ellington Road and Governor's Highway/Podunk Circle is a signalized four-way intersection with the following geometry:

- Governor's Highway – one shared right-turn/left-turn/thru lane.
- Podunk Circle – one shared right-turn/left-turn/thru lane.
- Ellington Road Southbound – one shared left-turn/thru lane, one right-turn lane with approximately 250 feet of storage.
- Ellington Road Northbound – one shared right-turn/left-turn/thru lane.

Site Driveway and Governor's Highway is a stop sign controlled "T" intersection with the following geometry:

- Site Driveway – One shared left and right-turn lane, allowing full movement for cars.
- Governor's Highway Eastbound – one shared right-turn/thru lane lane.
- Governor's Highway Westbound – one shared left-turn/thru lane.

4.0 INTERSECTION CAPACITY ANALYSIS MEASURES

Langan conducted capacity analyses for the existing, background and build traffic conditions to assess quality of traffic flow. Capacity analyses provide an indication of the adequacy of the road and intersections to serve traffic demands.

Level of Service Criteria

Level of Service (LOS) is the term used to denote the different operating conditions that occur at an intersection under various traffic volume demands. LOS is a qualitative measure that considers a number of factors including road geometry, speed and travel delay. LOS provides an index to the operational qualities of an intersection. LOS designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. The LOS designation is reported differently for signalized intersections and unsignalized intersections.

For signalized intersections, the analysis considers the operation of all traffic entering the intersection. For unsignalized intersections, however, the analysis considers the operation of all movements that are in conflict with other movements such as mainline

left turns and traffic exiting the side street. An overall LOS is given for signalized intersections. For unsignalized intersections, LOS is given for each specific approach.

The evaluation criteria used to analyze the study area intersections are based on the Highway Capacity Manual (HCM) 6th Edition, published by the Transportation Research Board (TRB). SYNCHRO Plus SimTraffic 10 was used to facilitate computer calculation for the capacity analyses at each intersection.

The HCM 6th Edition defines level of service for signalized intersections as follows:

<u>Level of Service</u>	<u>Control Delay per Vehicle (sec/veh)</u>
A	≤ 10
B	>10 – 20
C	>20 – 35
D	>35 – 55
E	>55 – 80
F	>80

The HCM defines level of service for unsignalized intersections as follows:

<u>Level of Service</u>	<u>Control Delay per Vehicle (sec/veh)</u>
A	≤ 10
B	>10 – 15
C	>15 – 25
D	>25 – 35
E	>35 – 50
F	> 50

5.0 METHODOLOGY AND ANALYSIS

To assess the potential traffic impact of the proposed development, Langan employed a five-step methodology outlined below and described in detail in subsequent sections 5.1 through 5.5:

Step One: Determine the existing peak-hour traffic volumes and evaluate existing traffic operating conditions for the study intersections.

Step Two: Project the existing peak-hour traffic volumes (Step One) to create 2023 Background peak-hour traffic volumes (including approved or pending developments in the area) and evaluate traffic operating conditions for the study intersections.

- Step Three: Determine the traffic volumes to be generated by the proposed development. Distribute and assign these site traffic volumes throughout the study area roadway network.
- Step Four: Combine the Background traffic volumes (Step Two) with the assigned proposed traffic (Step Three) to establish 2023 Build traffic volumes. Determine traffic operating conditions and identify mitigation of potential impacts.
- Step Five: Investigate the safety conditions within the area roadway network.

5.1 Step One: Determine the existing peak-hour traffic volumes and evaluate traffic operating conditions for the study intersections.

Existing Peak-Hour Traffic Volumes

Video turning-movement counts (TMC's) and vehicle classification counts were conducted on Tuesday, December 14 2021 to determine the existing peak-hour traffic volumes. The TMC's and vehicle classification counts were conducted on a weekday during the morning (7:00 a.m. to 9:00 a.m.) and evening (4:00 p.m. to 6:00 p.m.) peak periods of the development. The traffic counts were conducted when schools were in regular session. During these study periods, the peak-hours of the adjacent roadway network generally occurred from 7:15 to 8:15 a.m. and 4:15 to 5:15 p.m. We adjusted the traffic volumes to reflect peak-season conditions and adjust volumes as requested by the Office of the State Traffic Administration (OSTA). The traffic volumes adjustment was based on the expected traffic volumes from the Carla's Pasta expansion. The adjustment of the counts results in a conservative approach because the Carla's Pasta expansion has been operating since 2018 and its traffic is accounted on the collected traffic data.

2021 Existing Traffic Operating Conditions

The traffic operating conditions for the study area intersections were analyzed during the roadway peak-hour periods using the 2021 existing traffic volumes. Figure 3 illustrate the 2021 existing peak-hour traffic volumes. A summary of the traffic operating conditions is provided in Tables 2 and 3. Detailed reports can be found in Appendix B.

5.2 Step Two: Project the existing peak-hour traffic volumes (Step One) to create 2023 Background peak-hour traffic volumes (Including approved or pending developments in the area) and evaluate traffic operating conditions for the study intersections.

Background Peak-Hour Traffic Volumes

Background traffic growth was estimated based on historical data available from ConnDOT in the vicinity of the project. A review of the ConnDOT data indicates that traffic volumes in Windsor have fluctuated over the last several years, with a growth of 0.46%. In order to be conservative, a reasonable growth rate of 0.5% annually was applied to the existing traffic volumes to develop the 2023 background ambient growth peak-hour traffic volumes shown on Figure 4A.

We contacted the Town of South Windsor Planning Department and confirmed that there are no planned or approved developments in our study area. In addition, we reviewed the 2021-2025 ConnDOT Transportation Capital Infrastructure Program and found that there are no planned improvements in the study area.

2023 Background Traffic Operating Conditions

The traffic operating conditions for the study area intersections were analyzed during the peak-hour periods using the 2023 background traffic volumes illustrated in Figure 4. A summary of the traffic operating conditions is provided in Tables 2 and 3. Detailed reports can be found in Appendix C.

5.3 Step Three: Determine the traffic volumes to be generated by the proposed development. Distribute and assign these site traffic volumes throughout the study area roadway network.

The project includes the construction of a ±360,000 square-foot warehouse with approximately 318 car parking spaces, 59 trailer spaces, 30 tractor-trailer queuing spaces and 54 loading docks and associated site improvements (See Site Plan in Appendix A).

The site design also proposes construction of two site driveways, one connection to each Governor's Highway and Talbot Lane (See Site Plan in Appendix A). The driveway on Governor's Highway will operate as a full-access stop-controlled driveway for passenger vehicles only. The driveway along Talbot Lane will be a full-access stop-controlled driveway for truck-traffic only. The site has been designed to enforce the exclusive use of these driveways by locating all docks and trailer spaces and loading docks west of the proposed building and all passenger vehicles parking spaces east of the proposed building.

Peak-Hour Trip Generation

The anticipated number of peak-hour trips generated by the proposed facility is based on rates established in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition. Land Use Code 156: High-Cube Parcel Hub Warehouse was selected based on a representative trip generation estimate and the intended building use. Overall, the number of trips the proposed development is expected to generate is 275 for the morning peak hour, and 253 for the evening peak hour. **Table 1** below identifies the anticipated peak-hour trip generation of the proposed development using ITE data.

TABLE 1 - ANTICIPATED TRIP GENERATION – 25 TALBOT LANE WAREHOUSE									
USE	LAND USE CODE ¹	VEHICLE TYPE	DAILY	AM PEAK HOUR			PM PEAK HOUR		
				ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
High-Cube Parcel Hub Warehouse (360,000 SF)	156	PV	1,458	122	121	243	157	74	231
		Trucks	209	16	16	32	15	7	22
		Total	1,667	138	137	275	172	81	253

¹ Land Use Codes and Volumes based on ITE Trip Generation Manual 10th Edition. LUC 156: High-Cube Parcel Hub Warehouse.

The site-generated traffic peak-hour volumes were distributed to and from the site onto the roadway network based on anticipated travel patterns of employees and journey to work data obtained for the Town of South Windsor. The anticipated percent distribution of the site generated trips is illustrated in Figure 5. Figure 6 illustrates the assignment of the peak-hour site-generated trips, indicated in Table 1, into the area roadway network.

5.4 Step Four: Combine the Background traffic volumes (Step Two) with the assigned proposed traffic (Step Three) to establish 2023 Build traffic volumes. Determine traffic operating conditions and identify mitigation of potential impacts.

Build Traffic Volumes

To evaluate the impacts of the proposed development, the proposed trip assignment volumes (Figure 6), as distributed on the roadway network, are combined with the background traffic volumes (Figure 4). Figure 7 illustrate the 2023 build traffic volumes in the roadway network during the peak-hour periods.

Build Traffic Operating Conditions

The resulting traffic volumes illustrated in Figure 7 were evaluated to determine the effective operating conditions of the study area intersections without any proposed improvements. Tables 2 and 3 compare the traffic operating conditions for the study area intersections during the peak-hour periods. Appendix D provides detailed reports for the 2023 build conditions.

Queuing Evaluation

In addition to the traffic operating conditions, we evaluated the resulting vehicular queuing for all conditions to assess the impacts at study intersections. In evaluating queuing length, the industry standard is to utilize the 50th and the 95th percentile queue lengths developed by the analysis. The 50th percentile queue represents the average or typical vehicular queue that can be expected during the peak-hour. The 95th percentile queue length represents the queuing experience during the highest peak periods, which

accounts for 5% of the analysis period. Queues are calculated in feet, and approximately 25 feet of queue is equal to a single vehicle.

Tables 4 and 5 provide the expected 50th and 95th percentile queue lengths for the analyzed periods. For most analyzed intersections, queue lengths do not increase more than four car lengths. Any increase in queuing due to the proposed development is minimal and the existing roadway network can fully accommodate the anticipated queues.

Truck Access

The site has been designed to have all truck traffic access the site via Talbot Lane and by locating all trailer spaces and loading docks west of the proposed building. In addition, the development will provide 30 onsite tractor-trailer parking spaces that will serve as staging spaces to ensure that the anticipated truck-traffic can queue onsite without impacting Talbot Lane.

Analysis Results

The analysis of the study intersections reveals that all the signalized intersections analyzed will maintain overall acceptable or background operating conditions for the 2023 build scenario; therefore no mitigation measures at the three study intersections are proposed for the 2023 build scenarios. Individual movements and lane groups may change slightly in level of service, delay, and queue length; however, overall levels of service at these signalized intersections analyzed remain unchanged or acceptable, with nominal impacts to intersection delays.

We analyzed the proposed driveway connection to Governor's Highway and determined that is expected to operate with an acceptable LOS during the morning and afternoon peak-hour build conditions.

At the intersection of US Route 5 and Governors Highway during the morning and evening peak-hours the overall delay at the intersection increases by 2-5 seconds and changes from LOS C to LOS D in the morning peak hour from background to build conditions. Minor signal timing optimization at this intersection can mitigate these impacts and improve the expected overall delays at the intersection. These results take into account the projected volumes from the Carla's Pasta expansion and is considered a conservative approach because the Carla's Pasta expansion has been in operation since 2018 and accounted on the collected traffic counts. The analysis of the study intersections with the raw traffic counts show that there will be no changes in LOS with the project's impacts and therefore the roadway network can handle the nominal increase of traffic. At this time, no signal timing optimization is proposed as part of this application, however should conditions change in the future, the traffic signal timings can be adjusted.

5.5 Step Five: Investigate the safety conditions within the area roadway network.

Intersection Sight Distance

Langan evaluated the intersection sight distances (ISD) at the proposed site driveways on Governor's Highway and Talbot Road to confirm that they will meet the Town of South Windsor requirements for entering and exiting vehicles based on standards from ConnDOT Highway Design Manual Section 11-2. Sight distances requirements for the Town of South Windsor are based on minimum requirements established by the Connecticut Highway Design Manual and the American Association of State Highway and Transportation Officials (AASHTO) as outlined in *A Policy on Geometric Design of Highways and Streets*, 6th Edition (also known as the AASHTO Green Book). As shown in **Table 4**, the proposed intersection sight distances (ISDs) provided at the site driveways meet AASHTO's minimum requirements.

TABLE 4 INTERSECTION SIGHT DISTANCE SUMMARY					
LOCATION	Design Speed	Intersection Sight Distance			
		Passenger Car		Combination Truck	
		Required	Provided	Required	Provided
Talbot Lane & Governors Highway					
Left (Governors Highway eastbound)	35 mph ¹	±390 ft	>390 ft	595 ft	>595 ft
Right (Governors Highway westbound)	35 mph ¹	±390 ft	>390 ft	595 ft	>595 ft
Site Driveway & Governors Highway					
Left (Governors Highway eastbound)	35 mph ¹	±390 ft	960 ft	595 ft	960 ft
Right (Governors Highway westbound)	35 mph ¹	±390 ft	600 ft	595 ft	860 ft

¹ Design speed of 35 MPH based on an assumed 85th percentile speed (the posted speed limit of 30 MPH plus 5 MPH)

The driveway connection to Governor's Highway will be located approximately 960 feet east of Talbot Lane and 860 feet east of Baker Lane allowing all site-generated vehicle trips to access the site safely without impacting the existing connections to Governor's Highway.

Accidents

The most recent three years of accident data were requested via the online UConn Crash Data Repository website in order to conduct an accident analysis in the project vicinity. From August 2018 to August 2021, ten (10) accidents occurred in the vicinity of the site and the surrounding study intersection locations. Accidents included various types of crashes which are behaviors typical at signalized intersections. One fatality was reported in June 2021. Discussions with the South Windsor Police Department indicated that the fatality was related to a DUI. Four of the reported accidents resulted in injuries. The majority of accidents occurred during dry weather conditions (70%) and during daylight hours (60%). Table 5 provides a summary of the accident history.

TABLE 5
ACCIDENT DATA SUMMARY (08/2018 – 08/2021)

INTERSECTION	NUMBER OF ACCIDENTS		SEVERITY			CONDITIONS			
	Total	Average Per Year	Property Damage Only	Personal Injury	Fatality	Clear (Dry)	Rain/Snow	Day	Night
John Fitch Boulevard & Governor's Highway	9	3.00	4 (44%)	4 (44%)	1 (12%)	6 (67%)	3 (33%)	5 (56%)	4 (44%)

6.0 SUMMARY AND CONCLUSIONS

This evaluation identifies the potential traffic impacts generated by the proposed development on the surrounding area road network. We performed a capacity analysis for the existing, background, and build scenarios for three intersections. Our evaluation indicates that, the existing roadway infrastructure is adequate to support the nominal increase in traffic volume generated by the proposed warehouse development. No improvements are required or recommended at this time; signal timing optimization at the intersection of Route 5 and Governors Highway can improve signal operations in the future as needed. The development will install clear signage along Talbot Lane indicating no tractor-trailer truck can use Governor's Highway east of Talbot Lane. The development will provide 30 onsite tractor-trailer parking spaces that will serve as trailer queuing staging spaces to ensure that the anticipated arriving truck-traffic can queue onsite without impacting Talbot Lane. The proposed driveway connections to Governor's Highway and Talbot Lane are expected to operate with an acceptable LOS for the morning and afternoon conditions.

Intersection Summary

Area Type: Other

Cycle Length: 70

Actuated Cycle Length: 52.3

Natural Cycle: 65

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.87

Intersection Signal Delay: 20.1

Intersection LOS: C

Intersection Capacity Utilization 72.0%

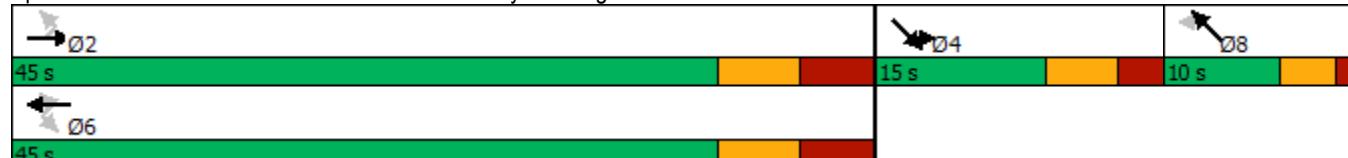

ICU Level of Service C

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Podunk Cir. /Governors Hwy. & Elington Road

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 16 (18%), Referenced to phase 1:SBL and 5:NBL, Start of Yellow

Natural Cycle: 85

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.91

Intersection Signal Delay: 33.0

Intersection LOS: C

Intersection Capacity Utilization 80.1%

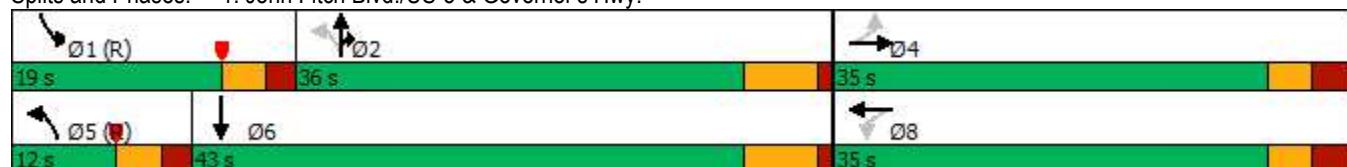

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: John Fitch Blvd./US-5 & Governor's Hwy.

Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 16 (18%), Referenced to phase 1:SBL and 5:NBL, Start of Yellow

Natural Cycle: 85

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.91

Intersection Signal Delay: 29.0

Intersection LOS: C

Intersection Capacity Utilization 79.6%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: John Fitch Blvd./US-5 & Governor's Hwy.
